In your previous message you mentioned that the Amiga was what the ST SHOULD HAVE BEEN... How true those words ring....

We all remember the thievery that went on when the Amiga was snatched out of Atari's hands at the last minute... I shudder to think what Atari would be today if the Amiga had stayed where it belonged.. Its more akin to the 8-Bit than the ST is by far......

Oh well....

6291. Re: Ghostscript- What is it?

Newsgroup: comp.sys.atari.st
Date: 1992-12-02 15:20:07 UTC
From: cbbrowne@csi.uottawa.ca
Message-ID: <1992Dec2.152007.29837@csi.uottawa.ca>
Source record: 214005

Ghostscript is a "freely available" (often called Public
Domain/Freeware - it's under the GNU Copyleft License, which is
another step different, but doesn't change the fact that it can be
freely redistributed...) version of the PostScript interpreter.

It's been written in C, with the "prime mover" being Peter Deutsch (?)
of Aladdin Technologies. It's been written with attempt to be
portable, and can be run on most of the systems that the GNU project
is trying to support. The Atari version has been kept pretty up to
date by Tim Gallivan (many thanks!).

It represents a "clone" of PostScript, that lets your computer
translate a .ps file into, um, some other form that may be directly
printed. It includes internally drivers for things like:
- Generic Epson-style printers
- Atari Laser printers
- HP Desk/Laser-Jet printers
- Screen (don't print - just display!)
and probably some other printers that I don't recall offhand.

It's actually more consuming of disk space than you may have initially
thought - you need something like gs252b.zoo, containing the programs,
as well as font files. The fonts amount to about 3MB, for a "nice"
set. Check in /atari/Gnustuff/Tos/Ghostscript for them. I think
they're packaged in 2 files. You basically need both such files.

It produces really nice output.

Can anyone tell me *why* DC Software has closed up shop? I had met Mike
Vederman a few times and he impressed me as one of the few people who
understood the business and programming side of running a company like DC.

Also, what is Keith's company going to be doing? And wasn't DC supposed to be
planning to aid in porting some Atari s/w to the Windows and DOS environment?
I'm at a loss as to why they went under....

<this all seemed to be a very sudden development...>

Also, didn't Mike V. recently make himself prez of the company? What happened
to Paul Lee (author of DC eXtract)?

>All this proves is that Windows is a slow piece of crap. You don't
>want a slow piece of crap? Then don't use Windows! Use OS/2 or one of
>the other GUI's for the PC.

There is no point to running ANY GUI on a PC unless the software you're using supports it's features. Your argument is LAME! Windows is by far the most supported GUI (in terms of use in software) so if you need a GUI you will be using Windows on top of DOS. Sure you can use OS/2 but that's just extra overhead for features that most current software does not take advantage of.

>As if Bob really needs to point this out. Come on -- there's NO
>argument that favors a closed architecture computer.

This is highly dependent upon your computer needs. For home computers, I know of only a few people who have actually upgraded the hardware of their PC from it's original state (and most of them just added a mouse or game port). The few who have found a need to upgrade have bought a whole new system because the cost of a new motherboard, new video board, new monitor, bigger hard drive, new DOS, Windows, etc. is more than the cost of a new bundled system. Open architecures benefit those who always need (or want) to have the latest and greatest. My 1040ST has satisfied my personal computing needs since 1987. I'm sure I'm not the only one who feels this way, I just may be the only one who will admit it! :-)

>In contrast, NO PART of my existing ST is useful now in terms of
>upgrades. I can't get any value for it when I upgrade. If I buy a
>Falcon (ha-ha, that's a good one), I pay the price for the whole
>machine: floppy drives, power supply, ports, keyboard, etc. -- things I
>already have in my ST.

Once again, it is a matter of need. If you need to have the latest and greatest, it is a waste to dispose of these good parts. If you get 5-7 years of use out of a computer before you require a new one, it probably isn't that bad replacing these components anyway. Besides, you would be able to use an ST monitor and SCSI hard drive on the Falcon, and these are perhaps the most expensive compnents that you need with both.

6294. Dragonware Software Exists!

Newsgroup: comp.sys.atari.st
Date: 1992-12-02 15:47:47 UTC
From: malay@sae.com
Message-ID: <1992Dec2.154747.7179@sae.com>
Source record: 214002

A while ago I posted a message that complained about the non-existence of Dragonware Software (their phone number listed in their ads + literature had been shut off). Well, it turns out they do exist, they have a new number (406)265-7300, and they solved my problem as quickly as they could.

One note for other Atari Vendors out there - when you change your phone number and disconnect the old one have the phone company generate a "the current number has been disconnected, the new number is ..." message for you. Its a good business practice, especially when you're running ads that list the old number.

In article <ByMp3A.1E7@sci.kun.nl> sanders@sci.kun.nl (Sander Stoks) writes:
>Come on Dave, don't get too excited.

Well, I should point out for everyone's benefit that I really *wasn't*
hurling furniture around the room in rage while reading/writing posts
in this thread. (I leave that to Neil.) In any case, it's a bit of an
emotional issue, but as I said I don't really have that much invested
in the success of my Atari stuff to really get excited anymore.

When I see a good, $2 billion a year company like Atari go completely
down the toilet, it irks me, that's all.

>The reason Blox didn't bring you as much money as Llamatron did to
>Jeff could simply be that Llamatron has become something of a cult
>thing.

Well if that's really true, then I have no problem with it. If no
one's registering my stuff because they think it sucks or is boring,
I'd really like to know, though, which is the main reason I reponded
to the "shareware that sucks doesn't get paid for" argument.

I've tried to make those games (HacMan, Blox, Snowball Fight) as
fun as I could. If they're actually boring and stupid, that's good
to know. I'll shelve any plans to be a professional game designer
in that case. :)

>I can't speak for the whole net of course, but I see you as The Sample
>Man, as I see Minter as The Llamatron Man, and Eric Smith as The MiNT
>Man.

What's really funny about this is that all the work with samples was
just an outgrowth of writing sampled sound routines for Game
Workbench. In fact, everything I ever wrote for the ST was an
outgrowth of Game Workbecnch, in some sense.

It's ridiculous; I have an AUTO-folder Cyber .SEQ player sitting on my
hard drive that I've just never bothered to upload. Once I had the SEQ
playing routines for GW done, the auto player was completely trivial.
(Of course, GW's SEQ loading stuff was a complete pain to write.)

>Perhaps you should do more about marketing, but then again, I could
>just have skipped the announcement in nn and thus not have heard of it.

Well I know that some things I've written have been on the cover disks
of some of the UK glossy magazines. I use to think it was Jeff Minter's
feature on ST Format that got him all the press, but now that I've
also been on there I suppose it can't have been that that made the

difference.

The idea behind shareware is that I want to write stuff you want to use (or play), but I don't want to make a full-time business of it. I'm willing to put a couple thousand hours of hacking into something that I'll except 10 or 15 bucks for, but I just can't be a full-time software dealer right now since I have other major time commitments.

Shareware seemed like a good compromise, and in the PC world perhaps it works well. But if people have the idea that you can just sit down and put your heart and soul into an ST program, polish it so it shines, put it out there and make some money, those people need to face the reality that it doesn't work that way (unless my personal experience is unique).

>P.S. Please don't leave the ST community, as your postings were mostly
>quite interesting.

This isn't meant to sound nasty, but what impetus has the community given me to continue writing free software for it? I never expected to get rich or famous writing ST software, but now the market can't even support commercial developers like DC. I gotta make some money to pay my rent. So it goes.

>P.P.S. Do you know whether on other platforms the shareware principle
>functions better? (Just asking);

I've heard more success stories. But admittedly, those may be flukes just like I suspect Llamatron is (not that it doesn't deserve to make money). In general I don't think shareware is really a viable option.

>have over copylefted software.

How about "it earns the programmers money they can feed their families with"?

>What good does all that sueing (sp?) and preventing people from
>using concepts, ideas and algorithms to the community of programmers
>and users?

Because if I come up with a brilliant new piece of software I don't
want Microsoft bloody stealing it! If I create some wonderful
innovation in the private sector, I want to be able to make a fair
profit from it. We live in a capitalist world. Given that, it's
simply not feasible to give commercial-quality products away. Everyone
else is earning their own keep and we must do the same.

Should car maufacturers be expected to give their vehicles away for
free? If you could copy a car with no cost or effort, would it be
reasonable to make cars copylefted and immune to patents? It's just
ridiculous; all that would happen then is that we'd have no car
manufacturers, no uniformity in safety features, and in general
complete chaos on the roads.

What about food? Should it be copylefted too? Then who would pay
the enormous costs of food perparation and processing facilities?

What *I* don't understand is why people think these absurd notions
are somehow reasonable for software -- that software is somehow
a different good, with special status.

Why don't you also advocate making books copylefted? Selling fiction
should become a thing of the past, you'd say. Then what would you tell
the great writers who as it is only make barely enough to live on, but
give the world so many wonderful gifts. Do you honestly think that if
fiction were copylefted, anyone would write books? It's hard enough to
survive as a writer as it is!

Yes, there are vultures out there. And in a world of vultures you need
to have some protection. To think otherwise is naive.

6299. TOS 2.06 -->1040ST with NOTEC

Newsgroup: comp.sys.atari.st
Date: 1992-12-02 16:38:52 UTC
From: rossin@hpfcso.FC.HP.COM
Message-ID: <7340105@hpfcso.FC.HP.COM>
Source record: 214033

I want to put TOS 2.06 into my 1985 1040ST but I don't want to pay
$140 for it. Also, I have a homemade daughter board on my 68K for a
12M byte external bus that I generate for DSP development which makes
the TEC board sound bad to me. I don't mind soldering wires and adding
an address decoder to get the job done. I just need to know if it is
as simple as remapping the BIG BAD ROMs into the ST address space.

A few questions I have are:

1. Is TOS 2.06 bigger than 192K? If so, does it fill in that extra 32K
before IO space.

2. If TOS 2.06 is 192K, can I take the two chip set and shove it into
a six chip set (I have access to an EPROM programmer). I have been
assuming that this is not the case becuase I have never seen TOS 2.06
offered in the six chip set (TOS 1.4 is). There may be some legal
problems, but I promise to destroy the two chip set if this does work.

3. What is the EPROM type that is used for TOS 2.06:
a. TC571000
b. TC571001
The above have different pinouts.

4. What else should I know.

PS. I have access to a logic analyzer so I don't mind doing experiments.
I'll probably just go for it. I post the results if others are
interested but I wont start work until Christmas.

Later

>
>I wondered how long it would take for the vultures to start circling..
>
>How long until the "good riddance.. we didn't need Double Click
>anyway" messages..?

I only purchased one DC package (DC Utilities), and I only use DC Squish out of all the programs included. I think DC Squish is excellent, but many of the other utilities suffered from either not having features that surpassed (or sometimes even met) similar PD software, or that the user interface was less than intuitive.

I was interested in DC Data Diet, but many posts of problems on GEnie made me squeemish. A very nasty reply to a mildly critical post of a DC marketing decision didn't do much to enamor me to the company (although it didn't alienate me either...my skin isn't that thin!).

I think the real problem that killed DC was that if the hardware isn't selling it is only a matter of time before the utilities market dries up. I've had my ST for five years. I've tried lots of utilities package, and now I've settled on a system that I'm comfortable with. Even if somebody comes out with some great new utility, I'm not likely to replace a utility I know and am comfortable with. Most of my software purchases in the last two years have been new and improved applications (Tracker ST and Abbreviator ST most recently), not utilities.

Look at CodeHead (or should I say Lookit CodeHead :^). While I believe that they sell the premium utilities for the Atari, they realized that the only way to stay in business was to start distributing imported applications packages. They also make an extroardinary effort to make sure their products are compatible with other programs. From what I could see, DC didn't try as hard (their Utilities package programs didn't even have hooks for the very common Little Green File Selector). Gribnif didn't roll over and die when many people opted to replace NeoDesk in favor of the new Atari Desktop: they went into the disribution business as well. Even the folks at Oregon Research have started branching out to graphics packages and more.

From what I could see, DC wasn't branching out as much or as quickly. Sure, the Storm package is coming out, but is yet another communications package really going to save a failing company?

Am I saying "good riddance"? No. While I didn't personally use DC products, I am sorry to see them go. But when you have a limited

utilities market and several US companies competing for it, only the strongest will survive.

>Does anyone else get an uneasy feeling in the pits of their stomachs
>about one of the premier software producers for the Atari line finally
>surrendering to the pressures of day-to-day reality...?

I'm not sure if the problem was day-to-day reality as much as a lack of business savvy.

>Let's see what we can get from them for free..

Well, at least have it be shareware so they have a chance of getting something out of it. As a writer (and purchaser) of shareware I know it won't be much, but better a little something than flushing it all down the toilet. Besides, one never knows when a shareware author will be approached with a business opportunity as a result of his PD work (it happened for me!).

>you're using supports it's features. Your argument is LAME!

You can run Windows applications under OS/2. Hence, software exists
for that GUI.

You can run X applications under 386 mach (with Unix emulator). Hence,
software exists for that GUI.

You can run GEM applications under PC GEM. Hence, software exists
for THAT GUI.

There you go -- three choices, all of which support as much or more
software than will run under GEM on the ST.

>Sure you can use OS/2 but that's just extra overhead for features that
>most current software does not take advantage of.

If that's your conclusion about it, then try one of the other two.
Since PC's run GEM you're in some sense moving to a superset of ST
applications as it is.

>This is highly dependent upon your computer needs.

Only if you NEED a useless paperweight in 10 years is a closed
architecture worhtwhile. What's WRONG with an expandable machine?
How is a closed architecture BETTER? Don't say they're cheaper,
because they're not anymore.

>Open architecures benefit those who always need (or want) to have the
>latest and greatest. My 1040ST has satisfied my personal computing
>needs since 1987. I'm sure I'm not the only one who feels this way, I
>just may be the only one who will admit it! :-)

Yes, but will it satsify your needs in 1999, when ISDN is ubiquitous,
terabyte writable storage is common, 500 mips computing is typical,
etc.? How long will you want to ignore the advance of the state of the
art? With every new technology comes some imrpovement in the way we
use computers, or what we can accomplish with them. In the long run

no one stays satisified with a closed archiecture. You could argue
that in 1900 you didn't have a phone, so you certainly don't need
one now. Walking to people's houses to give them messages works
JUST FINE. But this argument clearly becomes more and more absurd
as time goes on. Computers are even more poignant examples because
the whole world changes every 5 years. 18 months = a double in
computing power.

>Besides, you would be able to use an ST monitor and SCSI hard drive on
>the Falcon, and these are perhaps the most expensive compnents that
>you need with both.

And once I have the Falcon? (Which, with a 16Mhz 68030 is already
obsolescent.)

>

As mentioned previously, E. Arthur Brown is a current distributor of all the Antic (defunct) cyber-series programs. What wasn't posted, is their toll-free line: 1-800-322-4405
Incidentally, they are having a sale on all cyber-products at the moment. All those programs are going for '3 for $20'. Today, I ordered CyberControl and CyberTexture, and I believe they also have the full complement of Cybersculpt, Cybermate, CAD-3D, CyperPaint, and whetever else is in that line. I already have those mentioned, and at '3 for $20', I think they're all worth it (IMHO). The only one I use all the time, though, is CyberSculpt, which is recommended, and sold (I think), by Lexicor as the modeler of choice for objects to be used in their Phase4 series programs.

>Falcon. Lexicore's stuff, from the demo's I've seen, would be awfully
>slow on a stock ST, but it is very powerful.

As for Lexicor, you get what you pay for... Chronos, for example is a Keyframe Animator, which means that it offers a host of features that allow the user to only generate 'key-frames' and the computer will generate all the 'tween' (in-between) frames, as instructed. There are various degrees of smoothness, and other user-definable settings allowed, and it does require a bit of time to get up to speed, but it is a very powerful and versatile tool.
Another word about Lexicor (I am obviously a fan)...
Lexicor has an interesting base philosophy for their products. They claim to make their line 'platform and resolution independent'. The idea is whatever computer you use at one point, does not limit the life of your

project to that platform and resolution. The Phase4 stuff converts to/from and supports many (more than I knew of) graphic formats. Something that uses objects generated on a 1040ST with CyberSculpt can be animated on MegaSTE and rendered on a TT... and so forth, to any degree. You use whatever CPU and resolution that you want, but all your creations can still be rendered on other CPU's and in other resolutions. The compatibility is there. And the Phase4 line is also supposed to be compatible with Silicon Graphics IRIS workstation, which Lexicor also supports. Incidentally, on the compatibility issue, don't order CyberPaint if you have a MegaSTE. It just isn't compatible. (I know, I ordered it for mine). This is something that won't happen to you if you order Lexicor products. And Lexicor SUPPORTS their line. I know that word looks foreign to atari owners, but it's true. And Lee, if you read this, when do I get paid! 8^>

I'm having a similar problem with Converter, which comes with Spectre. I
can transfer text files Mac->ST just fine, but when I go ST->Mac, I can't
get any Mac programs to recognize my files. Does this have something to
do with how the "creator" and "file type" are set? How should they be set?
(I know, this may be in a manual, but I'd have to find it and..... :)

> architecture worhtwhile. What's WRONG with an expandable machine?
> How is a closed architecture BETTER? Don't say they're cheaper,
> because they're not anymore.

look, -any- machine is going to be a useless paperweight after 10
years. for most purposes you're doing pretty damn well if a computer
isn't completely obsolete in 5. the ST -is- expandable. if i owned
one i could add just about any peripheral i wanted to it. adding
more speed is another matter, but it is with IBMs and other 'expandable'
machines too.

the only -truely- 'expandable' machine would be a passive backplane
with parallel processing. even that would be outdated in 10 years
when its bus becomes obsolete. in the meantime you'd have to dump
tons of $$ into it to keep it current.

as long as your computer does what -you- want it to do you don't
need the latest & greatest.

> >Open architecures benefit those who always need (or want) to have

> Yes, but will it satsify your needs in 1999, when ISDN is
> ubiquitous, terabyte writable storage is common, 500 mips computing
> is typical, etc.?

i'm sure if he -needs- ISDN or terabyte drives he'll -buy- ISDN
connectors and terabyte drives and plug them into the ports
on his ST/Falcon. what's so difficult about that? as for 500 mips
computing, -no- current machine, expandable or not, will be able
to pull that. you'll end up with a whole new machine anyway,
so why not go with whatever suits your needs for now?

> How long will you want to ignore the advance of the state of the
> art? With every new technology comes some imrpovement in the way
> we use computers, or what we can accomplish with them. In the long
> run no one stays satisified with a closed archiecture.

in the long run we don't even -keep- the same architecture. we're going to be buying whole new machines in the future anyway, might as well purchase what fits our needs -now- & worry about the future when it happens. or have you bought into the big lie that any computer that's not the biggest & best is suddenly unusable? 80% of people i know who own computers don't need any more than a 386 or a Mac SE, but they buy it anyway, just to keep up with the Jonses. on the other hand, we've got my father, who's using dozens of applications daily on his old Mega2 and 20 meg HD. or the guy next to me in the lab, who's cobbled together an old Tandy system with some ancient 10 meg drives and an 8mhz NEC processor & software. yet he's doing more than most people do with a 486.

> >Besides, you would be able to use an ST monitor and SCSI hard

> >compnents that you need with both.
>
> And once I have the Falcon? (Which, with a 16Mhz 68030 is already
> obsolescent.)

you use it. until it no longer fits your needs. then you buy a new computer, just like all the Mac, IBM and Amiga people who've outgrown their systems.

>in that case. :)

Sorry to interrupt the Atari wailing session, but you did ask for some input
on PD games.

I don't keep many PD or shareware games I try, however HacMan II was one of
them. If that is a shareware game, I owe you some money. I think I tried
Blox. Was that a kind of 'Tetris in the round' type game with pieces coming
from all directions? If so, I can tell you why it didn't appeal to me.
Keystrokes! Any game that requires extensive use of a keyboard goes straight
to the bit bucket on my system. If I'm wrong, what is Blox?

Snowball Fight sounds like a game Analog magazine had for the 8-bit line. Is
this the same game? Did you write both? The 8-bit version was nice, but had
no computer opponent. That renders it useless most of the time with me.
It's not often I have a friend over to play video games.

Just my $.02.

Yes, it may be true that an open architecture is better for expandability,
but there are many people who don't need to expand!! I have had my 520ST
since 1985 and the only things I've done to it have been more memory
and a double sided drive. I have been quite happy with it, and yes,
I would have liked to upgrade it easily (i.e. higher video, faster processor)
but I realised that I could stilll do all that I needed with the set-up I
have.

Should people using manual typewriters (I believe there are still some
die-hard writeres out there using them!) go out and by a brand new color
laptop just because the typewriter is outdated, even though it does all
the things needed??

If it ain't broke, donn't fix it!

I'm sorry you have all these problems but many of us don't. I have a 4meg
STE with aproximatly 1.2 megs of Auto/Accesories to screw things up but it

dosen't. Try using vesrion 2.01K (i think i will check at home) It does not seem to have any problems. It supports both LH1 and LH5. I won't even go into which is better though. All users should be able to handle .ZIP .ZOO .LZH .ARC .MSA or any other format that comes up. It is not hard.

Source record: 214015

Hello,

I posted this once before, but with no responses. Can some kind [German]
please find out some information about the Graphics Cards produced by
"Matrix Datensystems" for the Atari ST. I beleive that they make a large
number of different cards, and from some magazines I gather that at least
2 of thier cards [the C128 and C32] are designed for a regular old ST.

I would like to know if they take orders from the US, and do they have
some sort of brochure describing what cards they offer. I am looking for
resolution on the order of 1280x1024, but I am not interested in a large
pallete as monochrome will do fine on my system.

P.S. If someone could find out if "Matrix Datensystems" has someone who
speaks english, Then I would call them and talk directly. All I need
is a phone number.

Many Thanks,
scott@dmi.stevens-tech.edu

I know of a guy (actually a few) in my area who have just finished thier BETA-version of a new UN-MSA it won't make them yet, just open them back up.

They obviously must have had somthing to do this, With their permission i might be allowed to upload it to either a.a or mail it to a few people who want to try it.. I have not downloaded thier beta vesion yet but i the archives directory of ummsa it is not a program but .TTP *ALSO* the complete file is about 2K, Thats right 2000 bytes or so...

6313. The Great Falcon Debate

Newsgroup: comp.sys.atari.st
Date: 1992-12-02 20:33:06 UTC
From: SML108@psuvm.psu.edu
Message-ID: <92337.153306SML108@psuvm.psu.edu>
Source record: 214021

After reading all the Falcon banter on here and on Genie, I'd like to post my views on why and why not buy a Falcon...

Reasons to buy a Falcon

It has a really neat DSP chip that definitely has some fascinating applications such as a 9600 baud modem, 16 bit sampler, and a graphics co-processor (This is almost reason enough for me to buy it)...

The Falcon will run ST software and David Small will most certainly adapt Spectre GCR for it so I can run Mathematica and any other mac application within reason...

Jim Allen will come out with a board which corrects for most of the mistakes made by its idiot savant designers...

I like being different...

It's cheap, not cheap like the ST was, but still decently priced esp. in comparison to a Performa, blech...

Reasons to not buy a Falcon

The Tramiels are boneheads, period...

Jim Allen shouldn't HAVE to correct for its design flaws but hey if it makes him money, more power to him...

No one is going to develop for this machine except in Europe...

Bob Brodie is a two-faced jerk who ought to work for EDS, no wait, EDS is too good for him, he should work for Jiffy Lube... If anyone needs intense comic relief, tune in to Genie and watch him vociferously deny any defect in the Falcon's design and when finally backed into a corner, watch him deny he ever denied it in the first place...

16 MHz in 1993, get a clue guys... 16 bit databus in 1993, ditto...

1040 style keyboard, YUCK! Especially when the Mega-ST keyboard already exists...

Well, it looks like we're stuck with the Falcon as is for now... So wait for it to come out as you've waited this long so what's a few more months? Try it out, and if you like it, get it. If not, get something else... The whole debacle has made me want to start my own computer company but alas I doubt that's practical... I just don't get why they didn't give the design to Jim Allen and David Small before they ever built a prototype and let them tell them what it should be... Ye gods...

I can't comment about using Zoo with a single drive, but expect you are wrong.

>
>LZH201x will extract to any drive and also creat a folder on demand, this is
>some of the things that ZOO can't do...

Zoo extracts to the current drive - most shells change the current drive to the one you specify before calling Zoo. Failing that you can open a window on the desktop that you want to extract to and double click on Zoo in a different window while holding down the right mouse button.

Zoo has an option to create folders as needed when extracting.

>computing power.

Come now Dave, surely you know that it's impossible to keep up with _every_
latest development in computer technology -- we're talking about home
computers for the "average" person here. Most people aren't going to
need a Cray II (which by the way has been out for a while now, why doesn't
everyone have one?) to write letters on their word processor, play a few
games, or balance their checkbook (not that a game wouldn't be pretty
cool on a Cray II :-). Unless some revolutionary new type of computer
application comes out in the near future, there is no point in buying
an overpowered machine. Multimedia would probably be a good bet for a new
processor-intensive application though, which will start taxing the limits
of our computing power. Notice however that this is exactly the kind of
thing Atari is setting itself up for with the Falcon and its DSP chip.
Your point about price is well taken, however -- I agree that, for example,
a 486/50 offers more raw computing power than probably an Atari of the same
price, but does that really matter? If 95% of the "average user"
applications run at equivalent speeds on the Atari (which I think you would
agree they do, funny considering the clock speed is so much lower... :),
it doesn't really matter that the technology is not as new. Also, I think
the phone vs. walking example is a bit extreme in this case -- maybe this
would be equivalent to comparing a VIC-20 to an Amiga 500, but there is

no disparity _that_ great between current MSDOS computers and their
competitors.

>
>>Besides, you would be able to use an ST monitor and SCSI hard drive on
>>the Falcon, and these are perhaps the most expensive compnents that
>>you need with both.
>
>And once I have the Falcon? (Which, with a 16Mhz 68030 is already
>obsolescent.)

Ok, once again, _any_ computer is obsolete the day it is released,
probably even before. If you constantly try and keep up with every little
advancement, you'll be shelling out big bucks every 6 months to get the
latest item. I think it's a much wiser strategy to wait for major
improvements (such as the move from floppy to hard drive, monochrome
graphics to SuperVGA/"true" color, or the Falcon's DSP chip) and keep
your system for a while. It's my prediction that once the potential of
the DSP chip is recognized, it will become just as standard on home
computers as hard drives have become today.

Well, first of all you need to be aware that the GFA BASIC compiler (doesn't matter which version) was _never_ placed into the public domain. If you need the compiler, you must purchase one from GFA Software Technologies (in the US) by calling them at 1-800-766-6GFA (I don't have the number for GFA Data Media in the UK or GFA Systemtechnik in Germany). If you have the original disk, I'm sure you can send it to them for a free or nearly-free copy. If you do NOT have the original disk, then you have a pirated copy and don't qualify for support. Get legit, please.

By the way, to find out which version of GFA you have, issue the command PRINT ERROR 100 in immediate mode from the interpreter. It will return some copyright stuff and the version number. I imagine you have the version 2.0 interpreter which was placed into the public domain some time ago. I don't recall the short-lived version 1.0 ever having a compiler.

Cheers,

>If you mean a PC-minitower: Mega motherboards do *not* fit in this kind of
>mini-towers -- it's even a pain to stuff them in big towers. And then...
>all the re-wiring, (expensive) cables, floppy&HD placement... Yack...

That's the truth; a Mega board is about 1 foot square. Most tower cases look plenty big on the outside, but internally a lot of space is hogged up by the disk drive bays. Mine barely fits into my full-size tower case, there isn't a hope of getting it into a mini-tower and still using the disk drive mounts.

(I.e., I found that the case had enough width and depth, but very few of them give you anywhere near 1 foot of height, taking the drive space into account.)

Another slight problem is that the mounting holes are nowhere near lined up between board and case, so you probably have to drill new mounting holes in the case. Finally, it is a real drag routing cables thru the rear of the case into the board; extension cables are a good idea for the printer and modem ports so you never have to swap 'em from the ST end.

Oh yeah, if you've got the (square) board oriented so that most of the connectors face the back of the case, your ROM port and keyboard cable jack will be on the bottom. I had to bend my ROM connector 90 degrees (parallel to the bottom) so I could still plug in my cartridge-port RAMdisk. Btw, the Mega just uses 6-line RJ-14 (telephone-style) cable for the keyboard, not that 7-pin inline header that other STs use.

********** READ THIS **********

You are not going to believe what I have just remembered reading in my about-issue-10 ST World a few weeks back - Back in '87, or whenever issue 10 was, Atari had just raised a load of money (Either by rights issue or asset sale, I can't remember). There was speculation that the money was to buy a controlling interest in CBM, since the amount would just cover this! Now I never heard what they actually used the money, but I have a feeling they blew it on Federated stores who have been losing large quantities of money ever since!

Just imagine where we (and Atari) would be today if they had bought CBM with it!!!!

I will check the magazine for the exact details when I get time.

There is a Module in Beta testing for S/SL called DATAFORMER and will export to almost 20 different formats. I don;t think it is usable on 1.09N. Call DMC Publishing (ISD) and ask them about using Ghostscript which is the new Postscript emulator for the ST.

Well that one was actually free, as was Snowball Fight. So you may continue
to lead a guilt free existence. :)

>If so, I can tell you why it didn't appeal to me. Keystrokes! Any
>game that requires extensive use of a keyboard goes straight to the bit
>bucket on my system.

The registered version lets you use the joystick, but it's still a
bit tricky. The basic problem is that it's hard to put 6 movement
directions and two rotations on a joystick without causing user
interface nightmares. (The diagonals on switch type joysticks are
really hard to hit sometimes.)

>Snowball Fight sounds like a game Analog magazine had for the 8-bit line. Is
>this the same game? Did you write both? The 8-bit version was nice, but had

>It's not often I have a friend over to play video games.

Actually it's a remake of that 8-bit game. My friends and I loved
beaning each other so much that I just had to write it for the ST. But
it is only two player, mainly because doing a computer player for it
would be a nightmare. (Real time trajectory calcualations on an
8 Mhz 68000 sounds like a real thrill.) Snowball Fight was a DC
program-of-the-week, and hence free.

>I've been using GCC for a while now and finally got around to trying the
>debugger (GDB) so I downloaded it from Atari.archive recently and gave it a
>bash...

... and you didn't succeed

you have to follow two steps to produce the executable program _and_ the
symbol table.

suppose, you want to compile foo.ttp from foo.c - you compile with debug
information, but you don't link your program:

gcc -g -c foo.c

then you produce the executable:

gcc -g -o foo.ttp foo.o

This calls the linker and links your object file with the appropriate
start-up code and the libraries.

and now the symbol-table

gcc -B<path/to/directory/of/sym-ld>/sym- -o foo.sym foo.o

This does the same as the last command, but uses sym-ld instead of
gcc-ld.

It may be possible to upgrade the cpu on PCs and MACs, and somewhere
people might actually do it, but in my experience when people want to
upgrade their PC or Mac (especially Mac), they just buy another one.
Some of the more technical look into what's involved in swapping
motherboards, consider the sacrifices, look at the new sleek cases at
new low prices and then they buy another one. I know people that
bought their first PC in ~ 84 that have bought 2 new PCs since.

The real advantage of an 'open' system, imo, is not the possibility of
upgrading the cpu, it's the ability to add peripherals. It has
disadvantages too: common things that might be standard on a more
closed system (graphics drivers, sound etc) have a variety of
protocols on PCs, and this complicates the installation of software.
For home applications at least, even the peripheral advantage is
disappearing. Many useful peripherals are now available with SCSI
interfaces. That you can't use a CD-ROM with an ST is not a hardware
problem; ACSI-SCSI devices have been around for > 5 years, but noone
has written code to use one of the many available SCSI-CD-ROMS, or
SCSI-ethernet boards. The problem is a dearth of software, not the
architecture.

OK the truth from my perspective is, that HacMan was quite fun, also
for whatever reasons (I think it was the behaviour of the ghosts) I prefer
playing the PAC-MAN cartridge on my old 8-bit. Blox I simply didn't get, I
remember that I thought the intro was kinda cool for a non-commercial
game, but the game itself was unappealing, probably just too complex
for my feeble mind. Now Snowball Fight really was terribly lame, at least
on my 8Mhz ST. Jerky background animation and the game-play of a type-in
BASIC game. [for the record I erased all of this stuff after testing]

>The idea behind shareware is that I want to write stuff you want to
>use (or play), but I don't want to make a full-time business of it.
>I'm willing to put a couple thousand hours of hacking into something
>that I'll except 10 or 15 bucks for, but I just can't be a full-time
>software dealer right now since I have other major time commitments.
>
You should do this like the writer of Oxyd and Spacola does, provide a
game which is fun to play, but where you need passwords after the
10th level to keep playing. I think that guy DID make some money with
this. He takes about 80DM or $50 for a printed booklet. He apparently
also does conversions now to the Mac and PC.

I actually think the only reason Jeff Minter gets so many registrations
is because he provides some otherwise unavailable goodies. So the
proper marketing strategy in your case would have been, give out Hac-Man
as shareware and Blox as the bonus for people who register. (If the bonus
is lame, the buyers can't complain, since they paid for Hac-Man anyway)

What you were saying in previous posts about noone developing wordproc.
for the Atari anymore is just true for the US situation. There are great
wordprocessors over here in Germany. Tempus Word2.0 is one of the best

wordprocessing tools in existance on this planet, and development is
not standing still. There's also Signum3, Papyrus, Cypress, Script and
lotsa others, which are not abandoned at all.

Just my thoughts, don't take it too hard
Nat!

>Yes, there are vultures out there. And in a world of vultures you need
>to have some protection. To think otherwise is naive.

Actually, there are things like Public Libraries all over the place where anyone can borrow a book, read it for free, and then return it, and the authors and publishers don't make a cent from that reader. Are you saying that public libraries are evil? Obviously folks are still writing books, and making a living at it, despite all this free access to their product.

And of course there's always been a huge amount of literature that's written that never gets published commercially, but still gets passed around or distributed one way or another. Lots of folks write for free, whether it's fiction or software. Copyrights are totally orthogonal to that issue...

Of course I'm sure that the deal concerned software for the PhotoCD.
I think this is the least thing Atari can do for the Falcon, because
PhotoCD is a favoured application for a multimedia machine.
What I wanted to point out is, that a contract with Eastman Kodak cannot
solve the lack of professional software for various purposes. It is sort
of an ignitial event, but not more. Tramiels answer was eluding.

Regards, Markus.

>>I don't understand what advantages copyrighted software should
>>have over copylefted software.

>How about "it earns the programmers money they can feed their families with"?

Copyright is one way of directing money flow from users to
programmers. There are others, which are more sensible and
prevent vultures from benefitting from work they haven't done
more efficiently. See below...

>>What good does all that sueing (sp?) and preventing people from
>>using concepts, ideas and algorithms to the community of programmers
>>and users?

>Because if I come up with a brilliant new piece of software I don't
>want Microsoft bloody stealing it! If I create some wonderful
>innovation in the private sector, I want to be able to make a fair
>profit from it. We live in a capitalist world.

Firstly, if you release software under copyleft, neither
Microsoft nor anyone else will be able to steal it. One of the
central conditions in copyleft is that nobody may sell the
copylefted stuff for profit or prevent free distribution of it.
Secondly, I think it's actually Microsoft and the like who really
take advantage from copyrighting software. Of course, if they
want to sell stuff from a programmer who is no employee of
theirs, they will have to buy the rights on that software from
him first. But then, they usually make much more profit than they
paid the programmer -- money for nothing. Remember: they're out
there to make money -- we're living in a capitalist world...

>Given that, it's
>simply not feasible to give commercial-quality products away. Everyone
>else is earning their own keep and we must do the same.

Well, it seems to be feasible in some cases after all. I only
know remotely about BSD, but it seems that it's feasible for them
to make their stuff freely available, at least if they don't lose
that lawsuit AT&T conducts against them, which seems to be rather
unlikely.
This case also shows how programmers and system folks can make a
living without copyright from offering support service and the
like. I heard these days that some folks from the BSD crew
founded a company called BSDI or something like that, making a

living exactly on this kind of offer.

>Should car maufacturers be expected to give their vehicles away for
>free? [...]

>What about food? Should it be copylefted too? Then who would pay
>the enormous costs of food perparation and processing facilities?

>What *I* don't understand is why people think these absurd notions
>are somehow reasonable for software -- that software is somehow
>a different good, with special status.

There is a fundamental difference between stealing food and
"stealing" software, namely that one who steals food actually
takes something away from the one whom he steals from, while one
who "steals" (i.e. copies) software does not. The problem with
copying is, as everyone knows, that it prevents the creator of
the copied stuff from getting his fair profit for the work. But
this is due to the way how the system that is supposed to
transfer money from the user to the programmer works. Given the
frequency at which copying takes place, I think one cannot be
satisfied with the explanation that all those who copy software
are doing so illegally, and that they are criminals. Rather, it
is adequate to question whether the system for distributing
copyable stuff is appropriate.
I figure it would make much more sense to raise some kind of
additional charge on all media, i.e. floppy disks, hard disks,
syquest media etc. This money should then be distributed among
those who have released software into the public domain. Such a
mechanism would bypass many of the vultures who make a big money
in software companies without contributing anything to the
computer community at all. A similar mechanisms has already been
implemented for audio tapes and xerox machines here in Germany
(the so-called GEMA-Pfennig), and it works ok.
IMHO, it's time face the fact that the mechanism of copyright and
associated laws nowadays fails to do what it was intended to do.
Instead of transferring money from users of software to its
creators with an endurable amount of administrative overhead, it
supports some gangs who make loads of money for nothing. Even
worse, the mechanism severely impairs information flow, which is
doubtlessly slowing down the pace of progress and therefore
detrimental to the whole computer community.

>Yes, there are vultures out there. And in a world of vultures you need
>to have some protection. To think otherwise is naive.

Copyright protects you against little vultures, namely ordinary
users, but leaves you helpless against giant vultures like
Microsoft. Copyleft doesn't protect against little vultures, but
against giant vultures. You've got to pick your choice...

>making a living at it, despite all this free access to their product.

Yes, but you can't make a perfect copy of a book, so there's still some impetus to buy the thing. And even though books are made available in libraries, they're still copyrighted. You can't plagiarize something wholesale and sell it as your own book.

But actually I do think libraries hurt the publishing industry enormously, though this is not to say that I don't think libraries are a good idea. And it is very infuriating to an author when someone says "Your book sounds great, I'll get it out of the library" when that author's living below the poverty line. Same situation that copylefting software would cause: an almost profitless business that keeps the majority of the artists on the edge of surivival. I don't see why anyone wants this for their field. You guys should really spend some quality time with full-time freelance writers before you advocate sending our business headlong into poverty.

Considering that perfect copies of software are trivial to make, I'd be willing to lay huge odds that a widespread equivalent to the public library for software would destory the software industry, utterly.

>Lots of folks write for free, whether it's fiction or software.

Most unpublished stuff is crap. There are a lot more would-be Great American Novelists than there are competent authors. The point is that these people don't make their livings off the stuff, so we don't really expect as much.

One further comment on the library analogy (since it is an illuminating one): My experience is that most new books you'd actually want are virtually unobtainable from libraries. It seems like books don't hit the stacks of Anytown Public Library until several years after their release, by which time they've sold well enough to make the publisher and author some money. This may just be because new books are reserved before they even show up, but whatever the reason there's always more demand for new books than there is supply in libraries, and this

creates a climate where most people have to actually buy new books if they want them soon after they're released. The same would not hold for a medium that can be copied without loss of quality, because there is an infinite "supply." And copying is the essence of copylefting.

>Well, since you have that attitude, we'll just write our software
>for markets in which people think software is worth paying for.
>
You sound bitter, and this is all a very sad business, but please try to remember the real problem--the size of the Atari market. I began using PCs and STs at the same time, and I have bought many, MANY commercial packages (mostly for the Atari),and I have paid for all the shareware I still use as well. Many other Atari users I have known have been at least as conscientious. The PC users I know, on the other hand, having greater access to unprotected software, are greater pirates. It matters little; the big money still comes from the companies and institutions for which these people work and from which they steal software. If there were ST packages in all the offices pilfering for home use would be as common, I'm sure. I am sorry you are leaving the Atari ST market--a number of new applications have appeared in recent months, and I was just beginning to hope that Atari was recovering. You are right to be annoyed with people who demand so much and offer so little in return; when you strike a larger market you will, I am sure, find more people who will treat you more honourably--I do not think, though, that the PROPORTIONS will change at all. As you point out, any assumption of fundamental differences between groups of users is nonsensical. Again, I am sorry to hear that you are leaving, and I wishyou the best of luck. And here's another weakness in the line-up of Atari software you might want to add to your list: there is no word processor with a macro language as fully developed as WordPerfect 5.1's. There is absolutely no reason for this except . . . the tiny size of the market. So there we are again.

>authors and publishers don't make a cent from that reader. Are you saying
>that public libraries are evil? Obviously folks are still writing books, and
>making a living at it, despite all this free access to their product.

The thing about public libraries is that it's STILL illegal to photocopy
the entire book. Sooner, or later, you have to bring the book back and
leave it behind.

Of course, if you REALLY like the book, you can go and buy your own copy
(I've done that on a couple of occasions).

The problem we have with software is that we compare the cost of the program
with the difficulty of duplicating the disk. (as opposed to the cost of
writing it ourselves). This leaves people unwilling to pay enough to the
people who write the software to make it worthwhile for them to do it again
(or improve the original).

If you want free software (and there are people who DO enjoy writing stuff
for free), then limit yourself to those who release their stuff to the
public domain -- This applies as much to programs as it does to paper
stuff.

Even in the case of postcardware, it pays the ego of the person who wrote
that program to know that you appreciate his work enough to mail a note
saying "Thanks for the good work".

Just remember that, sooner or later, you get what you pay for -- even if
it's as simple as there never being a "better" version written of the
program that you pirated a copy of because "Nobody bought a copy, so
I couldn't afford to work on a new version."

If you really like the ATARI, and you want there to be software for it,
you ought to be RELIGIOUS about paying the piper. It's a small enough
market without losing companies to tight-fisted users.

(Which all reminds me, I have some envelopes waiting to be mailed...)

>paid the programmer -- money for nothing. Remember: they're out
>there to make money -- we're living in a capitalist world...

What the heck is wrong with making money? If what *you* want happens;
i.e., that all software is copylefted, then NO ONE will make any money
off software, including the programmers. Read the first two lines
above -- you've spelled it out yourself. Why is it BETTER for me, as a
professional programming trying to pay his rent, to make NO money than
to make 15% of what Big Software Company makes marketing and selling my
software? How could widespread copylefting possibly NOT put
programmers out of their jobs?

Yes, we are living in a capitalist world, and I happen to like it that
way. But even if I wanted the world to be socialist, I STILL would be
adamantly against widespread copylefting and software unpatentability
exactly because it's NOW a capitalist world, and will likely remain so
for quite some time. Why do you want to devalue my skills to nothing?

>>Given that, it's
>>simply not feasible to give commercial-quality products away. Everyone
>>else is earning their own keep and we must do the same.

>to make their stuff freely available, at least if they don't lose
>that lawsuit AT&T conducts against them, which seems to be rather
>unlikely.

That work was FUNDED by a university! Sure, if someone's paying you to
program, make your stuff free. Works great for RMS; he gets a free
office in the lab here and no one says a harsh word. That's not what
we're talking about -- we're talking about regular people without
connections in high-power acadmic instituions writing regular
non-academic applications that the government isn't going to fund.
Under your plan, such things could not be sold for profit. So you tell
me who would pay those programmers' rents.

>There is a fundamental difference between stealing food and
>"stealing" software, namely that one who steals food actually
>takes something away from the one whom he steals from, while one
>who "steals" (i.e. copies) software does not.

If you get my work, which I put time into, without paying me for it, you're either stealing or taking advantage of my charitable nature. There are no other possibilities. If all software must be distributed on a charity basis, no software authors will be able to stick with their trade. Again, who's going to pay the bills?

>The problem with
>copying is, as everyone knows, that it prevents the creator of
>the copied stuff from getting his fair profit for the work. But
>this is due to the way how the system that is supposed to
>transfer money from the user to the programmer works.

But under your scheme NO money EVER gets transfered from ANYONE to the programmers! Copylefted means "no one can charge for."

>I figure it would make much more sense to raise some kind of
>additional charge on all media, i.e. floppy disks, hard disks,
>syquest media etc. This money should then be distributed among
>those who have released software into the public domain.

Who oversees this? Who determines how much of the pie I get for HacMan II? Do I get to lobby for more if I think my software was harder to write, or of better quality? What if I'm in desperate need of money and someone else isn't -- do I get more? It seems to me that you need God to decide such things, and God isn't available for the job.

>IMHO, it's time face the fact that the mechanism of copyright and
>associated laws nowadays fails to do what it was intended to do.

So instead of undermining it, lets make copyright laws more sensible. And let's fix the problem of patents costing $20,000 to get due to legal fees, so that they'll do what they were intended to do: protect the small businessman, and not simply serve as poker chips with which big compnies can extend their monopolies.

>Instead of transferring money from users of software to its
>creators with an endurable amount of administrative overhead, it
>supports some gangs who make loads of money for nothing.

If you think running a software company is easy, you've got a lot to learn. Just because it's not a "technically interesting" job to you doesn't mean it's trivial. You think you could do Bill Gates' job? While I think people like him can be misguided, greedy, and sometimes techically clueless, I think you MUST understand that management is not easy, particularly of a large company. And things like marketing, advertising, etc. -- while seemingly trivial to you -- are hard to get right, and are the backbone of the company. Those people earn their money just as much as you do. Read Peter Drucker's books on management and find out how nontrivial it all is.

>Copyright protects you against little vultures, namely ordinary
>users, but leaves you helpless against giant vultures like
>Microsoft. Copyleft doesn't protect against little vultures, but
>against giant vultures. You've got to pick your choice...

Exactly how does copyleft protect software in any way that copyright doesn't? Copyleft is just like copyright but you have to give the software away for free. I fail to see how this offers any additional protection.

This looks like it's somewhat up my "alley". The sources are on their way to my Sun account even as I write (pretty big - 708K as a compressed zoo file - what's in this thing?!?!?)

Bug me NEXT week about it; my thesis is very nearly done, and that's causing me to forget about anything I'm not continually reminded about. Hopefully it can work.

It may be like the p2c translator (pascal to c) in that it's nice, but impractical to actually get compiled. I hoped to get p2c going, and may have posted to that effect. I guess I have to comment that I failed. :-(

Actually, p2c could be compilable by those kind people like Howard Chu/J. Bammi that have gone to the trouble of setting up GCC cross-compilers on their favorite workstations, specifically for the purpose of cross-compiling enormous programs, notably GCC. MANY MANY MANY THANKS.

p2c could be quite popular; it recognizes several dialects of Pascal, including Modula 2 and Turbo Pascal. If anyone with a cross-compiler expresses interest, I can direct you towards where sources are available :-). It's supposedly fairly portable; running properly when compiled with GCC.

Interesting, how is this additional fee administered and distributed?
Here in the US we're the lucky benefactors of a tax on blank tapes,
the proceeds of which goes to the recording industry. (As if all blank
media purchased in the country is purchased for audio use. Yeah, right.
Lots of folks buy DAT cartridges for computer backups, but there are
no exemptions from this tax... [btw, I'm not certain that the tax was
actually passed, and even if passed, it may not be too late to write
to congress-folk and complain and get it repealed...]) Apparently the
big record companies thought they needed protection from all the audio
pirates out there and this is how government responded. Wonderful how
government responds to the needs of its clients...

Well, I must admit I do enjoy being employed as a software engineer here
at JPL, and earning money for hacknig on stuff. But I think that's a side
issue, really. There are certainly lots of full-time free-lance contractors
doing very well for themselves in the computer software business. One
doesn't need to accept "the industry" to keep up in the field.
>
>Considering that perfect copies of software are trivial to make, I'd be
>willing to lay huge odds that a widespread equivalent to the public
>library for software would destory the software industry, utterly.

I think the software industry is in need of a bit of shaking up anyway,
personally. Looking at a "healthy" software market, in the PC world, where
typical productivity packages sell for around $350 a copy, you have to wonder.
These companies brag about being the #1 selling item in thus and such
category year after year - selling millions of copies of stuff, more than
recouping the cost of R&D, but still gouging the hell out of customers.
That irks the hell out of me.
>

>>Lots of folks write for free, whether it's fiction or software.

>
>Dave Baggett

My experience with most libraries has been more along these lines: the staff only has so much time to review new publications, evaluating whether to add them to their collections. If you specifically request a title, you will usually have it in your hands in short order. (Or rather, if a title is requested enough times by enough people, etc...) At any rate, I haven't felt quite the lag that you're illustrating.

Of course, ownership and usage of a book isn't quite comparable to that of software. Most books only get "used" (read) once or twice, and then sit on a shelf to collect dust. Software may get used over and over again, and so has more lasting value. This seems to be the only basis for charging anything in the first place - how much lasting value will the software provide? If I were to copy a game, play it once, decide it was garbage and delete it, I would not consider that to have harmed the author in any way. On the other hand, if I were to buy it shrink-wrapped/sight-unseen and get stuck with a piece of garbage, I would say that I have been abused if I am unable to return the thing for a refund.

I'm not saying that software authors shouldn't be compensated for their work, and I'm certainly not advocating piracy. I pay good money for the games software that I have, and I develop as freeware just about everything else that I use.

In My Pompous Opinion, people who write software solely to make a buck should leave the field to people who are in it solely for personal satisfaction. Leave it to people who actually care about what they're doing, what they're crafting,

people who are so driven to hack that they'll do so regardless of outside compensation.

You may think "what an utterly ridiculous and unrealistic view" there but think about it a bit more. Look at the video game market, for example. For every single good game that came along you had a zillion knockoffs trying to capitalize on the game's popularity. But even before there *was* such a thing as a video game market, there were hackers writing games for the sheer amusement of writing them. Keep the copyleft aspect, kill the profit aspect of the "market," and all the money-grubbers will go somewhere else leaving only the dedicated purists to turn out decent work. They've been there since the start, and external changes won't make 'em stop...

At this point you could say "that's totally naive" and I'd be hard-pressed to provide a counter-argument. I guess the main point is that getting rich shouldn't be your only motive in any pursuit, doing a good job should be the primary motivation. When you've done something and done it well, getting it done is its own reward.

Here is what I heard from Atari's quarterly earning report.

THe ST BOOK was put on the back burner. Ths due to the fact that it had
no disk drive. They were working on it, but pushed it aside for the Falcon.
Do not expect to see the ST Book, my assumption, it's gone for good.

Falcon030, due on limited quantities sometime over the next two weeks to
US dealers. Europe is already seeing small supplies enter the area.

Jaguar, to be introduced at the summer 1993 CES and available by
September.

Portfolio II - work suspended.

Falcon 040, to be introduced "Real Soon Now."

I just hope Huey, Duey and Lewie(Sons of Tramiel) get knocked off or something
so we can get some BUISNESS people in there to get the Falcon out the door
correctly...

Source record: 214049

The only way ZOO can redirect it's output using the 'run from unselected window' routine, is on more recent versions of TOS. (It sure doesn't work on v1.2) newer versions, I presume may be able to, as they have folder/directory etc. redirection sorted out. (Hence the not being able to 'Install Applications' from within folders on older TOS versions). It will try to look for them in the root directory! (e.g. A:\ C:\ etc.)

It's not a problem for anyone to be able to use any extractor. If you don't want to archive files with LHarc, no biggy! Everyone should be able to use ZOO (even if they have to copy ZOO.TTP to wherever they wish to extract the files to). as well as ARC, ZIP, etc. etc.

Remember folks, when people talk about using software, there is a fairly good chance they will have either TOS 1.2, (STFM etc.) or TOS v1.6/1.62(STE) and be running from the GEM desktop. Not Un*x (which the machine is not designed for - so why use it all the time?? - get the real thing if you want something). So, if you don't try running whatever you are having problems with from the GEM Desktop, don't complain!! (Unless it is SUPPOSED to run under MiNT/PowerDOS/Un*x/Emulators etc. etc.

6346. How do I turn on keyclick in Uniterm?

Newsgroup: comp.sys.atari.st
Date: 1992-12-03 06:02:07 UTC
From: bcc@lanai.Eyring.COM
Message-ID: <1992Dec3.060207.15895@fcom.cc.utah.edu>
Source record: 213901

The subject 'bout says it all. When I'm using Uniterm, I occasionally press a key more than once because I can't tell if the first keypress registered (slow host on the other end). When it does respond, I get a whole string of characters. Is there anyway to turn on keyclick in uniterm so I can hear when the key is pressed?
Thanks!

Yes, it will be fun to play around with.

Interestingly enough, I called a local ST BBS, and lo and behold they
had a huge file with a DSP Assembler (.ttp), sources too, and a truckload
of DSP 56000 assembler programs that do reverb and other interesting tricks.
If it is not available on the net, let me know.

>Reasons to not buy a Falcon
>
>The Tramiels are boneheads, period...

Hear Hear!

>exists...

Agreed.

>Well, it looks like we're stuck with the Falcon as is for now... So wait
>for it to come out as you've waited this long so what's a few more months?

No, "dammit", i'm tired of waiting. The machine looked fine
when I saw it at the Atari Messe, they should'nt be stalling,
it has been over 3 full months since I saw a decent working
version of the Falcon, and an "apparently" functional Multitos.

I ran out of drool.
I'm now running out of cool.
By the time the Falcon comes out,
will I be finished school? (2-4 years left in university)

And now, to go into the domain of the Ridiculous. (Atari deserves this:)

The Falcon Chant:

Come on Atari, its time to groove,
Get that Falcon on the move.
Lets see some action, mirrors & smoke.
If you don't soon, you're gonna croak.
Cause we won't take it, wanna know why?

We won't wait until donkeys fly.

>
Interesting. The first 520STs sold in the US had 512K, TOS in RAM, and no internal drive. When they added the built-in floppy drive, they changed the name to 520STFM. Maybe Atari planned to make a 256K machine, had a few thousand "260ST" cases made, then decided that 256K really wasn't enough RAM.

Source record: 213935

Has anyone here on the Atari group ever seen/used the progeram on the Mac called Claris Works? It is something I used in a (class) group project that one of my group-mates has. A fantastic piece of software. It's sort of a combination wordprocessor/DTP/simple-spreadsheet all at once. If anyone who's used Claris Works, or knows what it's like could let me know what the Atari can offer like this, I'd like to know what it is. I have Pagemaker (not version 2) and as far as I can tell, it sucks. This could be because I have no hard-drive, but since I can run it from a BIG Ram-disk, I wonder if an HD would really make any difference.

Anyone?

>Leave the dedicated purists to turn out decent work. They've been
>there since the start, and external changes won't make 'em stop...

I used to think this way. I *am* one of those people who's written hundreds of thousands of lines of code just for fun. I think I've made about $50 total off my ST programming. But your belief that nothing could make them (me) stop because they love it so much isn't true in reality. I'm stopping. Is it because I don't like doing it anymore? Is it because I now "just want to make a buck?" Because I've become an evil capitalist pig-vulture software fascist?

No, it's because I can't *afford* to do it anymore! I've got bills to pay. We're in a recession. I just can't justify it anymore. If somebody wants to write me check for my $10,000 of living expenses for the year, I'll be MORE THAN HAPPY to keep on writing free ST software. But as it stands I have no more time to give to writing free software.

I don't even want to *think* about how bad things would be if all software were copylefted.

>At this point you could say "that's totally naive" and I'd be hard-pressed to
>provide a counter-argument. I guess the main point is that getting rich
>shouldn't be your only motive in any pursuit, doing a good job should be the
>primary motivation. When you've done something and done it well, getting it
>done is its own reward.

Though I've certainly done all my programming with enjoyment as the primary motivation, it doesn't mean I don't want to recover the opportunity cost of having done it. I have never once in this thread said I wanted programmers to "get rich," only that I think that copyleft will rob us of our *fair* compensation -- compensation which is required to keep us alive in a capitalist world.

The other point that I think copyleft advocates miss is that without adequate financial support most products would either never get written or would be crap. I'm a reasonably generous person; I feel I've done quite a bit for the Atari community gratis -- but there is no way in hell I would have invested 4 years of my life co-writing the 2

megabytes of source code that comprise GW if I'd known I'd never even make up the cost of the hard drive I bought to develop it on. Not just because it would be utterly insane to do so (e.g, I probably could have earned thousands of dollars working for a company in that time, and wouldn't be completely destitute now), but because products that don't have financial backing are almost invariably inferior to those that do.

If GW goes out as shareware it will suffer. As a commercial product, it would have a nice, bound, comprehensive, easy-to-read manual written by someone who knows how to write manuals well. As shareware it will have no manual, or a bad one, unless Neil and I choose to put another 1000 hours of charity work into writing man pages for all the 450+ GW functions.

As shareware, GW would have no user support. It's a big, complex system. I suspect that without adequate user support many potential users would get lost in the complexity.

I could go on listing reasons. But instead, let's consider what is probably the pinnacle of free software success: GCC. GCC is inferior to commercial compilers in every way except one: code generation (a category in which it is quite superior). But there's a lot more that "normal" people need from software: support (none for GCC -- if you can't figure it out you're screwed, and don't think everyone has Internet access); documentation (for GCC? I laugh in your general direction); reliability (GCC's pretty good here but still has bugs if the posts here are any indication); easy installation (GCC: ha ha ha! Times 10 for G++); nice interface (much as hackers like me love command lines, they sure don't cut it with the masses), etc., etc. etc.

It's a great piece of work ... for a free program. But overall it's far less than what typical users expect; they expect something comprehensive and easy-to-use like Borland C++ on the PC. (Using gdb after working with the Borland source code debugger is like chiseling things out of stone.)

My point is that you just won't see stuff like Borland C++ get written in a copylefted world. Such things require too much personpower and too much organizing and too much initial capital to get them off the ground. Half-baked free software, even if it does its job well, may cut it with you and me -- experienced hackers -- but it won't go over with the general public. Joe Paradox spits on your home-grown database. He wants the features he's used to, and in a polished, easy-to-use package (yes, with a GUI) with a bound manual that's written in terms he can understand. This ain't copylefted software I'm describing -- certainly not what's available today.

Richard Stallman can't understand why anyone would want to use MacWrite instead of Emacs. I think that just about says it all. We've got two separate cultures colliding here. It's a testament to his charisma and persuasiveness that he's managed to convince so many people that the

computer world is a place fit only for diehard purists who think it's GOOD to have to type Esc-x auto-fill-mode to get words to wrap. I think we could all benefit from making our toys more accessible to "normal" people, and widespread copylefting is at odds with this goal.

Finally, the oft-quoted idea that "everyone will chip in to make something REALLY great" has NEVER worked out in reality. Read rec.games.programmer for the "Ultimate Internet Cooperative Game Lib" thread that comes back like a yo-yo every few months. Will it ever happen? Nope, it's too complex, too much work, too hard to coordinate. (And that's something I can definitely attest to on the basis of personal experience.)

Good products need some kind of backing to succeed. They need to be polished, supported, have good documentation, and all the trimmings. Such things come at a price, and that's why good software will always be copyrighted and the world at large will never embrace the copyleft. Which is as it should be.

Perhaps $350 is not a fair price for a C++ development system. But I would argue that whatever the fair (and healthy market) price *is*, it's a lot more than zero.

If you think about it, free accesss to books is probably the only way MOST (99.999%) people get any sort of affinity for reading. I'd guess that without Public Libraries, probably less that 10% of people would actually ENJOY reading.

I'm pretty sure this type of model applies to books, and am equally pretty sure it does not apply to software. Sorry I couldn't slove _that_ problem...:)

Original to: wsbusr3@rw6.urc.tue.nl
w> Hi ST - boys & girls,
w>
w> I've got a major problem with my 1040ST's internal 720K drive.
w> It's broke.

Hmm. Not funny...

w> It has rumour that most internal IBM-drives can replace it
w> effortless - with some modifications to the ST's cover that is.

Generally, yup.

w> So I tried a TEAC 1.44 (internal) drive.
w> Without a HD-kit an/or different controller it would act like a 720K-
w> drive, and I could always upgrade it later with a kit/controller.
w> So I'm told by several people.

Well, there's a bit more to it than that.

w> <CLICK> ST ON
w> TEAC 1.44 drive starts spinning, yet fails to read my 720K bootfloppy.
w> After 30 sec's the dektop shows up anyhow.
w> The drive simply continues spinning !! (without reading anything.)
w> <CLICK> ST OFF
w> I tried the same with the big black connector upside-down
w> (as was the power-connector, so "who knows..", I figured)
w> The drive then didn't do a thing, though. (which was better than
w> exploding in my face, ofcourse).

Eeek. If you flipped the power cable over you probably toasted the drive.
You _might_ be lucky, but I don't think so.

The 'drive spins always' problem means you have the data cable (the ribbon)
upside down. It's also likely that, because the drive is inteded for a PC,
it's jumpers are set to be drive 1. The ST uses the bus 'properly', and so
the drive should be jumpered as drive 0.

There should be a little cluster of microscopic jumpers near the back of the
drive, and some printing that should help you to work out that there are
four numbered 0, 1, 2 and 3. Very rarely they will be numbered 1, 2, 3 and
4. There may also be the letters 'DS' near them (Drive Select).

As well as this, the drive is probably configured to be a 1.44 drive, and
you might want to change that - there may be more jumpers marked 'HD' and
'DD' or similar.

However, if you have reversed the power connector, the drive is probably toast, which is fine, as Teac drives have a notorious problem in that the ST has great trouble in detecting a disk-change.

w> QUESTIONS:
w>
w> * My dealer offered me to try his Mitsumi 1.44 and Y-E-Data 1.44
w> drives as well. If they don't do the job,

I can't quote on the Mitsumi, but I used a 720K Yedata for quite a while, and when it finally died (I rescued it from a cracked controller board, and my repairs finally gave out) I replaced it with a 1.44 Yedata jumpered as a 720.

w> I'll get a 80% refund :-(.

I think you'll have to wear it - if he tests the drive, you may get less 8(

w> Will they be any good?
w> What brands usually would?

I can vouch also for the Mitsubishi 1.44's, and of course the original is an Epson (I think, or maybe a Chinon) so they should work also.

w> * Can a 1.44 plugged into the ST as is indeed perform like a 720K drive?

Usually, see above.

w> * The black connector is way to the right compared to my ST-drive.
w> Should I solve this with more flat-cable?
w> Are those cables available with pins on one end,
w> and holes on the other?
w> (otherwise I can't even build those drives in properly)

No, I had to remove the original controller cable from the motherboard and install a longer one. It's not a very easy task, but sometimes these things just have to be donw. 8(Most 'other' (ie non-epson or chinon) drives have the data connector up the other way...

w> * These IBM-drives are also 1/2 an inch lower than the usual
w> internal ST-drive.
w> How does one normally go about building them in neatly?

No problem - bolt the drive in, then sort of dangle the case over the top and work out which bits to cut off... 8) I have an unpleasant gap above the mitsubishi in this machine that means that if I miss, in a hurry, the disk goes scooting across the top of the drive and crashes into the power supply shielding. Not harmful, just very embarrassing!

w> Suggestions, shared experiences, solutions and sheer laughter
w> with respect to some, most or all of these 4 questions
w> please to this group or else to: at073@cleveland.freenet.edu

You got it!

>to the "shareware that sucks doesn't get paid for" argument.

Well, this is what I thought of Blox (I got it off a cover disk)...

Blox looks and sounds really good, but the game play lets it down. I
know Tetris has a cult following, but in the end after a couple of hours it
gets increadibly teadious (spelling?). The same is true, if not more so,
with Blox.

With games it's the playability which matters, not the flashy
graphics. There are many games which I'd go back and play again and again,
hardly any of them have flashy graphics or samples! Flashy graphics may get
the initial interest, but if the game's concept isn't up to it people will
just drop it after they realise that it's nothing but flashy graphics.

>
>I've tried to make those games (HacMan, Blox, Snowball Fight) as
>fun as I could. If they're actually boring and stupid, that's good

>in that case. :)

Don't give up, I'm sure you've got the talent, it's just that truely good games concepts are illusive! eg. Elite (Acorn BBC micro model B original disk based version only), Dungeon Master, Defender, Asteroids, Battle Zone.

[Stuff deleted]

>that it doesn't work that way (unless my personal experience is unique).

From what I hear, shareware on the PC works as well or worse than on the ST/TT, it's just that there is a larger population, so the monitary returns for the same or smaller percentage of returns is greater.

>
>>P.S. Please don't leave the ST community, as your postings were mostly
>>quite interesting.
>

>>P.P.S. Do you know whether on other platforms the shareware principle
>>functions better? (Just asking);
>
>I've heard more success stories. But admittedly, those may be flukes
>just like I suspect Llamatron is (not that it doesn't deserve to make
>money). In general I don't think shareware is really a viable option.

With Llamatron and Jeff Minter you have a large number of nostalgic buying as all the shareware programs you see from Jeff are based upon his old 8-bit games for the Sic-VIC (sorry, an old rivalry showing up :-)) and the Commodore 64. Anyone remember Gridrunner on the VIC-20? I must admit it was one of the best games. The reason.. it had a simple concept!

i> incompatibilities, just this one.
```

If you turn on the 'strict parameter checking' (or similar - I gave up on TP in favour of TC a while ago) option under TP you will get the same error message. If PP is really as 'compatible' then you should be able to find a similar option somewhere.

w> and MS-Windows view of things where windows are all there is?

No - I think that one, possibly highly-desirable option would be to provide some form of configuration option that allows an application to take over the entire screen. - When run, a new block of screen memory is allocated, and the application uses this screen as opposed to the 'default' screen. (You'd need some form of hotkey option to swap back to the 'default' screen - but, presuming the AES/VDI are flexible enough, you could run this new screen in a different resolution even. (maybe start a new copy of the desktop in it, or whatever...)

l> Apparently they are selling it abroad. I think GPT manufacture it.

There's an australian company (based in sydney, from memory) who have developed a proprietary compression algorithm that lets them pipe sampled audio (sorry not sure of sample size, but I think ~10HKz, mono, 6 bits or maybe better) down a 4800bps async serial link. Given a v.32 bis modem, and a fast enough JPeg algorithm, you have about 10Kbps to put your pictures in.

Anyone know how quick the current Jpeg code for the 56001 is?
Anyone know anything about this audio compression algorithm?

>whether or not the memory is syncronous or asyncronous. With the
>claimed 16 bit bus I'd expect 2.0 -> 3.0 mips, depending upon memory.

A few people have suggested that they added the MIPS value for the
68030 to the 56k MIPS value to get to the 30 to 35 MIPS. This is clearly not
true. The correct way to arrive at the performance factor of the Falcon
is to MULTIPLY the real-world MIPS values, taking into account bus sharing
with video etc, ie just under 3 MIPS multiplied by just over 10. :-)

What the above paragraph translates to is "Don't believe what you read in
ST Format/User/Review. They're written by complete bozos" (Er, allegedly).

is
b> wrong with my copy or (god forbid :-) my TT?

I can quite confidently vouch for the fact that Llamatron (the 1meg version)
runs fine on a TT with 8M and Tos 3.05

However, it will not work with the ICD hard disk driver installed. (and
possibly also not with any other HD driver.)

Also, you need to turn the cache off, as it uses self-modifying code in the
sample playback routines.

You do not need any 24-bit fixes.

b> Bill

I don't know about 3.06, but I can't imagine it would cause much trouble.
(make sure you haven't got the fastload, TTram or TTmalloc flags set on the
program either)

[Stuff deleted]

There is also another argument...

PCs look upgradable, but are they really?

Just think... If I bought a typical top of the line IBM PC-AT in the mid
'80s for a large wadge of money, what would need to be done to get it to the
average PC of today?

(1) Replace the mother board with a 386 motherboard.
(2) Replace my memory board cos the memory I had on my old board wasn't SIMMs
(3) Add an extra few megs of memory.
(4) Replace the PGA video card and monitor with a VGA card and monitor.
(5) Buy a mouse.
(6) Buy a new version of MSDOS.
(7) Buy a new hard disk and a 3.5" floppy. I can't fit any of the new
software on a 20MB hard disk, and I can't get much on 5.25" floppy
any more!
(8) Buy Windows 3.1, cos that's what all the new machines come with these
days.

What could I use from my old machine?

(1) The case.
(2) The power supply.
(3) The keyboard.

Total cost to replace these items? About a hundred pounds, maximum.

The total cost of buying the bits to upgrade the machine would probably cost
more than buying a new machine with today's crazy pricing.

Also remember, all your old components are getting older.. the chips on the
boards have a guarranteed lifespan of only 7 years.

6365. Re: Atari 130ST and 260ST

Newsgroup: comp.sys.atari.st
Date: 1992-12-03 10:07:04 UTC
From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <70813@cup.portal.com>
Source record: 213910

Strange how the word "Atari" seems to affect a lot of people's memories..

OK.. here's how it WAS...

Creative Computing magazine, March 1985..

Cover, in a box at the bottom: "Atari 130ST: Macintosh Successor?"

Page 59: "Atari Strikes Back"...

"With six promising computers that could re-shape the industry"

(Lotsa "blue sky" stuff about how Tramiel and sons are gonna take over
the computer market")

"The 130ST and 520ST"

"Perhaps the biggest news among Atari's planned introductions is it's
"blue line" of computers, called the ST (for Sam Tramiel?) series.
Characterized by a blue logo, they constitute nothing less than Atari's
"Manhatten Project". It may be fair to posit that if the Macintosh was
the A-Bomb of microcomputing, the Tramiels intend to unleash the fury of
the H-Bomb. ...

Like the Macintosh, the 130ST is a 128K micro based on the MP 68000
processor. (Dum de do... lots of ST specs here.. you all know them
already..)

"As for our own observations, we find Atari's new strategy very interesting.
It includes something to aggravate almost everyone currently in the
microcomputer business...

"Naturally dramatic introductions like this will be greeted with
skepticism. Commodore under Jack Tramiel was notorious for announcing
products that never made it to retailers' shelves, but Atari's Kerr
claimed the 65XE was in production as this was written (mid December,
1984) and that the 130ST would be in production by the time you read
this...

"If all (or indeed most) of this is true, the Tramiels will have once
again wrested the destiny of consumer microcomputers and molded it for
many months to come."

Deja vu, eh..?

Hmm.. ya know...

Back when Commodore first introduced the Commodore 64, they advertised that it would have a CP/M emulator among all of its wonderful features..

But guess what.. there wasn't enough interest from "real" buyers to warrant their actually finishing the product, so the CP/M emulator was dropped..

Strangely enough, a lot of people who bought the C-64 because Commodore had advertised that there would be a CP/M emulator were unhappy.. and they got together and sued the company for false advertising... and guess what...!

Commodore Business Machines was forced to actually produce the CP/M emulator, and live up to their advertising...!

(Isn't America wonderful..??)

So, boys and girls... all of you who bought TTs, on the promise of "UNIX ASV" from Atari, Corp. might take a lesson from that nasty Commodore Business Machines company.. which just coincidentally was run by the same Mr. Jack T who runs Atari...

"Buy our computer, and we promise to promise you anything to get you to buy our computer"...

Didot LineArt Pro. can load Calamus documents, and supports postscript output....
bit of a longwinded way of going about it though (I could do with a PS driver to).

6368. Re: Good Bye Double Click

Newsgroup: comp.sys.atari.st
Date: 1992-12-03 11:07:09 UTC
From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <70816@cup.portal.com>
Source record: 213913

Hmm... Ed Krimen writes:

>>Does anyone else get an uneasy feeling in the pits of their stomachs
>>about one of the premier software producers for the Atari line finally
>>surrendering to the pressures of day-to-day reality...?

>Day-to-day reality didn't have anything to do with it.

I see.. you must figure that Mike and Paul and Keith didn't
have to eat like everyone else.. they were "Atari programmers"
and thus "above" earthly limitations like that..

They could just go on, day after day, putting themselves on the
line for us and Atari Corp, and not getting anything back for
it...

When Practical Solutions went out of business, all the Atari
Vultures immediately jumped on them, saying it was their own
fault they couldn't survive..

When Avante Garde folded, the Vultures accused them of being
"shady businessmen", not worthy of surviving in our midst..

What we need are Atari Saints, who don't need to eat, who don't
need to feed or clothe their families (as Saints, they wouldn't
have families anyway, having given their lives to Atari), and
who are willing to keep on investing their time and lives
to produce products we can upload to Atari.Archive when their
companies finally die of starvation.

Before you sneer and jump to your keyboards with the mandatory
Atari Apologists response, answer me this.. do you have a
"real job"..? Do you get a paycheck (and thus FOOD, and RENT)
from a "real" job..? Do you have to rely on the vagaries of
the Tramiel family to feed your own family..?

If the answer to the last is NO, then I propose that you have
NO basis for criticism.. NO basis for any opinion at all.

Grow up.. join the real world.. find a life beyond cheerleading
for Atari.. use their computers as computers, but don't delude
yourself into thinking that supporting Atari is something you
should base your life around.. there are plenty of real world
examples to show how foolish that can be...

6369. Falcon availability in Germany

Newsgroup: comp.sys.atari.st
Date: 1992-12-03 11:09:00 UTC
From: Peter_Missel@k.maus.de
Message-ID: <A42478@K.maus.de>
Source record: 213659

Hi everybody!

jmillar@thomas.helios.nd.edu (Di, 01.12.92 22:56) asked me to:

j>post to this newsgroup some information concerning
j>Falcon availability in Germany (or anywhere else for that matter) ?

Falcon 030 demo sets have been given to Atari dealers for about one month now, including microphone, stereo speakers, 128 MB MO-drive and (of course) a 4/65 meg Falcon.
Obviously, a considerable number of new dealers, as well as some warehouse chains that had taken Atari out of their program a few years ago, have signed dealer contracts for the Falcon line of products.

"Small quantities", whatever this may mean, are promised to be shipped this year; full mass availability is planned for february/march 1993. (As said in a dealers' mail from Atari Germany.)

have fun - Peter

(I like the Falcon030!)

>
>>DC-...

Jeff Minter offered a copy of Andes Attack to everyone who registered.
This is much more of an incentive than an improved version of a game
which you already have. In a sense Jeff's approach to Llamatron wasn't
really shareware at all - people were buying Andes Attack for their
£5.00 because Llamatron acted as a good advert for Llamasoft.

I'm not saying that all shareware should necessarily work like this -
I think its a shame that people don't just register for something they
like, unfortunately the incentive just isn't there.

Sam.

>junk or extracts........

An earlier version that I used to use couldn't redirect it's output, but the
most recent version (1 year old) and the version before that (at least 3 years
old) can redirect it's output.
In fact, thank you for bringing this up because it means you can extract
a file to any drive/directory - just use the P option (pipe to standard
output) and then redirect the file to where you want it.

That may not be an altogether good idea... the S/R ration in Fido is a lot higher than it is here, and depending on which Fido echo you would want to gate, you'd have in the worst case a doubling of the traffic. In the best case
there'd be no additional traffic at all. :-)

You are right of course. However I could have pointed out that on TOS2.05
and above you can install Zoo as a desktop icon and it will then simply
extract into the top window.

>It's not a problem for anyone to be able to use any extractor. If you

>SUPPOSED to run under MiNT/PowerDOS/Un*x/Emulators etc. etc.

That's why I test all my programs on a machine with TOS 1.02 before releasing
them - to make sure they are usable on the widest variety of machines
possible. For the same reason I archive them with Zoo because most people
have this archiver. I would use ARC because this used to be the standard,
but many people don't have the newer versions that can handle directorys.
ZIP is a very nice archiver in many ways, but the fact is most people don't
have a copy.

The reason I mentioned Unix was
a) I thought the Unix version of LHarc would be more stable.
b) I like to download stuff from a.a, dearchive it on Unix and read
the documentation files before transfering it to my ST. I haven't got time
to transfer every single file that I think might be useful, based only on
it's filename. Unless I have been recommended a program I will not download
.LZH files because I have no way of telling what they are about.

It would be nice if every thing on a.a was packed with the same archiver,
with a copy of that archiver .TTP form in the root directory. Either Zoo or
Arc would be fine with me.

I would like to add my entire agreement with Mr. Baggett in this thread.
There are a number of points I would like to add :-
Writing commercial quality programs takes a _lot_ of time.
In many cases several man lifetimes.

Hacking code is fun -
professionally robust, documented and supported software is
a bitch to write - why else do I get paid to do it?

Object oriented methods are a ray of hope in all this. They may take
away a lot of the ground/grind work requirements in software production.

NeXTstep will also help in GUI production. (soon to be available on
IBM PCs NOT Ataris)

TeX is the best hope for documentation but its HUGE. (I want uTeX!)

How to make money out of shareware and PD -
form a P.D. library
publish a magazine with a cover disk
freeware bastardized versions
(It is unfortunate that on single users machines there is no easy way
to timebomb software so free shareware usage could be restricted)

How not to make money from shareware, freeware and PD -
form a programmers co-operative
write begging README files
offer noting in return for their money

Unknowns :- Licensing your stuff to PD libraries.
QUESTION : How well or badly is Budgie software doing?

I too am disappointed by the ignominious retirement of GWB. I enjoyed
seeing Dave's games on Mr.Forsyth's machine (I don't have a colour monitor/TV
so no shareware fee oweing) but I cannot blame Mr.Baggett for his withdrawal
from the Atari scene. I hope he has a very productive - and profitable -
future in whatever he decides to do next.

TTFN
David

p.s. for Mr. Chu information (caveat : The following applies in the U.K.
I don't pretend to know about the U.S.A.) :-

There is no such thing as a free school lunch - public lending libraries
cost taxes.

In the U.K. certainly book copyright messages exclude unauthorised publication, copy or lending.

Public libraries DO have to pay for books - they have to pay PREMIUM rates for hard covered - library bound editions and I think some other fee to the publisher. Video libraries pay a lot of money for a video they are allowed to rent.

>

A recent .EXE magazine (thats a Unix & PC software developers Journal) article had a big interview with Berkley, in which they stated that they were attempting to pull out all the AT&T copyrighted code from BSD Unix, and replace it with thier own for placing into the public domain as the FINAL issue of BSD Unix. Berkley Software Division is dispanding (or may already have done) due to lack of funds.

So as a passing comment, it isn't just the Atari world that is suffering from the good guys losing.....(witness the death of DC...).

6380. hard drive woes -- help!

Newsgroup: comp.sys.atari.st
Date: 1992-12-03 13:29:49 UTC
From: scoile@gmuvax2.gmu.edu
Message-ID: <1992Dec3.132949.28435@gmuvax2.gmu.edu>
Source record: 213925

I seem to have an intermittant problem with my hard drive. Every once in a while, it seems to get sensitive to the *smallest* of bumps. One day, I can knock my desk all over the place, drop books on it, and what have you, and no problems with anything. The next day, someone walks by with a heavy step and the HD spins down slightly, then back up and initializes itself. Of course, when it does this, I have to rerun my HD driver *sigh*.

I was wondering if this problem occurs to a lot of people. Can anybody give me some advice on how to cure it, or does it sound like a major problem that'll require my trekking up to Toad to get fixed?

Many thanks in advance, with more to follow any replies I get vie e-mail! =)

-Steve Coile

Regarding ZIP, I am using STZIP2.0 and just this weekend I had a problem
with a ZIP archive. I zipped a bunch of files and the unzip failed. The
offending file was an LHARC archive. Now that may seem unusual to put an
LHARC archive in a ZIP file, but I wanted to archive things on a floppy and
ZIP shouldn't be sensitive to the kind of file. I suppose this is a bug. Do
others have similar experiences?

|>
|> BobR

There are at least two clones I know:

One is about 3 or 4 jears old called something like ST 190 build by
a german firm called IPB or something like that. They use reall Atari
chips and compressed an st520 to 3 euro-sized boars (The size of an
VME 3U board). I believe they had SCSI Harddisk support and up to 4M
RAM.

The other is done by a german comuter magazine called elrad earlier
this jear. They are using 3 euro-sized card with their own bus, but
I think they had VME Slots on theire backplane. These boards are
supposed to include an 68881/2 up to 14 M of RAM (with special MMU).
If someone is interested I will look up the exact specification and
the numbers of these articles.

In article <1fin7nINN859@life.ai.mit.edu> dmb@xbar.ai.mit.edu (David Baggett) writes:
Well I know that some things I've written have been on the cover disks
of some of the UK glossy magazines. I use to think it was Jeff Minter's
feature on ST Format that got him all the press, but now that I've
also been on there I suppose it can't have been that that made the
difference.

Over here in the UK, Jeff Minter is very well known. I know people
with no net access, who never read computer machines, but know who
Jeff Minter is. The reason is simple - his reputation was built up
over years, starting with his VIC-20, C64 and 8-bit Atari games.
There are an awful lot of twenty-somethings who played Jeff Minter
games when they were kids.

I've had this method fail (Hoped for destination window topped, unZOOed files ended up in the directory with ZOO.TTP). I wse a CLI or move a copy of ZOO.TTP to the destination folder. Odd 'eh? This is under tos 1.4 on a Mega.

Hasn't this happened on your system? (Leo?)

Maybe my ZOO.TTP isn't current. It does have the "high compression" option.

Hi, I hope someone can help me.

I have been getting problems with setting up my hard disk write cache and read cache to be most affective, Has anyone got any ideas how to do it ?

I have come to the stage that when i write files onto my drive it takes longer than writing the same file to a floppy.

I wrote a 77byte file to my hard disk and it took about 20 seconds, It does not speed up much when not using the cache either so I have not got it setup wildely wrong.

System Setup :-

Atari 512 STFM (Expaned to 2.5meg)
Third Coast Hard disk Kit.
Seagate ST157N-1 type hard disk (50 MB)
Mono Monitor
HP Deskjet +

Anyone know of any reasons why it takes sooooo long to save files.

Any help would be greatfully received. Thanks.

Simon Love.

I was reading where Berkeley is finished with BSD and won't be doing more updates, due to lack of funds I think. A group in Colorado is trying to get funding to continue updates.

The people involved with the lawsuit with AT&T are selling BSD for pcs, aren't they? Sounds rather capitalist :-)

>Interesting, how is this additional fee administered and distributed?
>Here in the US we're the lucky benefactors of a tax on blank tapes,
>the proceeds of which goes to the recording industry.

I must admit that I'm not really informed about the GEMA Pfennig
mechanisms and background. I'll try to get information and post
if I find something.
My previous posting implies that the GEMA Pfennig goes directly
to the authors, as I described in my suggestion. However, I'm not
sure whether this is the case, it may well be that the publishing
industry benefits from the GEMA Pfennig in the first place and is
supposed to pass this on to the authors (which I'm sure they
don't do completely...). Thus, the current GEMA system may not
reduce the "vulture overhead", but it can still serve as a model
how authors can be protected without impairing information flow.
I should point out that the GEMA Pfennig doesn't imply that all
copying is legal here in Germany. It's legal only for nonprofit,
private purposes and only to some certain extent.

>(As if all blank
>media purchased in the country is purchased for audio use. Yeah, right.
>Lots of folks buy DAT cartridges for computer backups, but there are
>no exemptions from this tax... [btw, I'm not certain that the tax was

>pirates out there and this is how government responded. Wonderful how
>government responds to the needs of its clients...

Putting the tax on DAT cartridges really is especially brain-
damaged. A PD-tax, or whatever term is appropriate, should only

be applied to media from which software can actually be run. Of course, the tax you describe is not even raised with any intention to support PD or shareware programmers, or programmers at all...

I agree with this totally.I'm a hard up student and would love to register
for more shareware games,but I just can't afford to.I will be going into debt in
the very near future just to buy a Falcon(when Atari finally decide to start
shipping them to Britain en masse).Shareware registration is well down my list
of priorities.I know this is hurting the ST market badly,and I do not want to
see this happen on the Falcon.

>What the heck is wrong with making money? If what *you* want happens;
>i.e., that all software is copylefted, then NO ONE will make any money
>off software, including the programmers.

Nothing is wrong with making money as such. A whole lot is wrong
with making money without doing anything for the community.

>Read the first two lines
>above -- you've spelled it out yourself. Why is it BETTER for me, as a
>professional programming trying to pay his rent, to make NO money than
>to make 15% of what Big Software Company makes marketing and selling my
>software? How could widespread copylefting possibly NOT put
>programmers out of their jobs?

Of course, copylefting alone can't feed any programmers. The main
goal of copylefting, as I understand it, is to ensure free
information flow, not to ensure that programmers are compensated
for their efforts.
However, copyrighting is just one way of coupling using software
to compensating authors. There are others which are more
compatible with free information flow, which is definitely needed
by programmers in the first place.
Another point is, would you be satisfied with an OS gobbling up
85% of the CPU time, leaving only 15% available for user
processes? Certainly not. By the same token, there's no reason to
be satisfied with getting 15% of the profit others make with your
work.

>Yes, we are living in a capitalist world, and I happen to like it that
>way. But even if I wanted the world to be socialist, I STILL would be
>adamantly against widespread copylefting and software unpatentability
>exactly because it's NOW a capitalist world, and will likely remain so
>for quite some time. Why do you want to devalue my skills to nothing?

David, I assure you that I don't want to devalue your skills to
nothing, and I don't think any of the net.folks around here does
so. I emphasize once more that I fully recognize that programmers
must be compensated for their efforts. But I'm sure that
copyrighting is not the best way to ensure this.
Regarding socialism, there's no such thing as a boolean choice
between capitalism and socialism. The fact that some of the
things I argue for are different from what traditional and pure

capitalists advocate indicates by no means that I want anything
to be socialist. I don't care about those *isms that much at all.
Whatever *ism, it is for sure that it needs to be constantly
updated and adapted to novel technologies, opinions, ways of
life, dreams, visions etc., and in the course of this, structures
and mechanisms that have worked more or less ok may prove to be
inappropriate under new or changed conditions. This is what I
think happened to the concept of copyrighting and patenting with
the advent of digital information storage.

>But under your scheme NO money EVER gets transfered from ANYONE to the
>programmers! Copylefted means "no one can charge for."

Copyleft means that no one can charge for copying. It makes no
statement at all about charging for hardware.

>>I figure it would make much more sense to raise some kind of
>>additional charge on all media, i.e. floppy disks, hard disks,
>>syquest media etc. This money should then be distributed among
>>those who have released software into the public domain.

>Who oversees this? Who determines how much of the pie I get for HacMan
>II? Do I get to lobby for more if I think my software was harder to
>write, or of better quality? What if I'm in desperate need of money
>and someone else isn't -- do I get more? It seems to me that you need
>God to decide such things, and God isn't available for the job.

I never claimed that the scheme I suggested was perfect, that's
why no "God" is needed for it. I claim that the scheme is better
than copyrighting because (1) it doesn't interfere with free
information flow and (2) there's less administrative overhead.
The best idea for determining the share a program author gets for
his work I can think of is that the computer community, i.e.
programmers and users, self-organize to care for that. Another
idea, which may again nourish the suspicion that I'm advocating
socialism, is, of course, that the government organizes the
distribution of the money. Right, government institutions aren't
known for their efficiency, but still I'm sure that, if the
institution is designed to be under tight democratic control of
the computer community, it could do with an overhead much smaller
than 85%.

>So instead of undermining it, lets make copyright laws more sensible.
>And let's fix the problem of patents costing $20,000 to get due to
>legal fees, so that they'll do what they were intended to do: protect
>the small businessman, and not simply serve as poker chips with
>which big compnies can extend their monopolies.

While I doubt that copyrighting si themost sensible way to do
things, I fully support this suggestion. I think it's an outrage
that one has to pay lots in order to actually getting the rights
one has according to the laws.

>If you think running a software company is easy, you've got a lot to
>learn. Just because it's not a "technically interesting" job to you
>doesn't mean it's trivial. [...]

I never said it was easy, but I do think that managers are
exceedingly overpaid with respect to those whose work they
market.

>>Copyright protects you against little vultures, namely ordinary
>>users, but leaves you helpless against giant vultures like
>>Microsoft. Copyleft doesn't protect against little vultures, but
>>against giant vultures. You've got to pick your choice...

>Exactly how does copyleft protect software in any way that copyright
>doesn't? Copyleft is just like copyright but you have to give the
>software away for free. I fail to see how this offers any additional
>protection.

There's no additional protection, there's a choice to be made.
You can either prevent users from getting your work for free, or
prevent Microsoft etc. from getting the money for your work for
free. Neither of these are satisfactory, that's why I think a new
concept is needed.

Source record: 213946

In article <1fgfi9INNju6@life.ai.mit.edu>, dmb@case.ai.mit.edu (David Baggett) writes:

>... But at the moment I can upgrade my existing
>system to the next generation of processor for just the cost of the
>motherboard (or, if I choose to go to a clock-doubled 66DX-2, the cost
>of the chip itself).

I always find such broad claims to be a bit on the, er, wild side. Scanning through the December 1992 Computer Shopper, I located an average 486-33 motherboard (WITH CPU and EISA bus -- many of the prices people have been flinging around don't even include the 486 chip!) for about $1100. You can, of course, purchase a brand new Falcon, complete with all of the things that you want to scavage from your XT (including that slow 20-megabyte hard drive that IBM used back in the dark ages, er, mid-80s). True, you've managed to keep your CGA monitor, but you'll want to upgrade that particular item as soon as possible -- after all, Windows doesn't even RUN on a CGA monitor ...

So - people are complaining about the non-upgradability of a nicely designed closed system (the Falcon) while ignoring the fact that upgradability for your current (non-ST) system costs as much as a brand new Falcon, or more!!

Those who like the Macintosh speak in the same garbled language. True, I can (and have) upgraded a Macintosh SE to a Macintosh SE/30. Basically, they replace everything except the back shell, the power supply and the dinky black and white monitor. What you DON'T hear is that the upgrade cost is in the neighborhood of $1,000! And, you DON'T hear from those (like me) who've owned the original 1984 128K Macintosh which can't be upgraded to any 68020 or 68030 computer chip (let alone more memory than a stock 1040ST...)

And how far could you upgrade a typical Apple][? (This =despite= the internal, expandable slots!) My upgrade to an Apple //e consisted of selling the old computer and purchasing a brand new one! Considering that I paid LESS for my original Atari 1040ST than I did for the Apple][(AND the Apple //e, come to think of it), the "upgrade" to a 1040STe was tiny. The "upgrade" to a Mega4 ST was small.

The "upgrade" to a full-blown Falcon won't have cost me any more than the purchase of a //e cost me back in 1984. It also won't have cost me any more than the purchase of a (now-defunct) 386SX in 1992.

Upgradability is fine if you have the money. For every microcomputer system with which I am familiar only the Atari ST is inexepensive enough in the first place to make the purchase of a BRAND NEW MACHINE less costly than an "upgrade" to a new CPU for those other machines.

Those with external hard drives haven't lost anything in the transaction -- they can still USE those external hard drives with the Falcon. They can still USE those printers and external modems with the Falcon. They can still USE the original monitors that came with their ST. How's that for "upgradability"?!?

Do not archie files with ST-ZIP v2.0 It's very fast as doing it, and eveb faster at extracting, but it's compression routines seem to have a glitch in them. They don't work most of the time!

Just use an older version. v2.0 is fine for extraction though!

Just a question about something puzzling in this statement:

If you only have a single drive ST, what other drive would you be redirecting
output to? As far as that goes, most of the 'user friendly' shells for LHArc
and ZOO archivers will create a folder for you...

6407. Game Workbench (was Copywrong and ...)

Newsgroup: comp.sys.atari.st
Date: 1992-12-03 20:22:12 UTC
From: hutch@bellman.lanl.gov
Message-ID: <1992Dec3.202212.6856@newshost.lanl.gov>
Source record: 213862

<in reply to 59955, not repeated here to save bandwidth :) >

That's a very good summation, Dave. Many programmers who would cheerfully hack away for nothing simply cannot afford to anymore due to the economic pressure that we all feel. And the "depressed" Atari market doesn't help!

But even considering the current Atari situation, I'll bet there are a LOT of folks out there who would be more than willing to lay out a few sheckels for a professional, well-written and _comprehensive_ package such as your Game Workbench. I suggest that many, many C programmers would love to be able to incorporate some special effects in their own code if only they knew how to do so! Trouble is, it's just too big a chore to track down how. That's why I thing something like the Game Workbench is sorely needed _and_ wanted by lots of beginning to intermediate level Atari C programmers.

In my experience, folks don't mind paying a fair price for their software as long as they feel they get their money's worth and support is there when they need it. <mindless, spineless pirates need not apply> Borland doesn't sell thousands of copies of BC++ because it's the only game in town... they sell that many because it's a good product which is well packaged and supported.

IMHO, we want the Game Workbench and are willing to pay for it. Just do it!

>(68020 at 20Mhz) running Unix adequately. I don't think any of them had X, but
>for crying out loud, they ran Sunview. These Sun's were about all we used here

Well, I don't know if the TT is too slow for X. We also have a Sun 3/50 in
our lab, and it's running X! Well, yes it's running as an X-terminal off
of an SGI right now (at a good speed), but it used to run as a workstation,
itself. It was a bit slow, but not unbearably so.

So, yes, I do think a TT could handle X. Sure, speed-wise it wouldn't be
GEM, but for those of us who like a GUI, it would be good enough.

Well I certainly don't, because on this very disk I have one packed
accessory, JAMES.ACC, takes something like 12000 bytes packed. Some
accessories can't be packed, like Miniterm, but James definetly can be
packed. And I think the same goes for TurboST.

Leo you can't Pack ACC with PFX its because a ACC must include all
is memory allocation from with in its self, it that simple..

ACC's can't allocate any more memory, unless you can trick the system
by adding more to the BSS segement.

This is what Thomas Quester informed me, but NOTE: DC Squish can, but
we don't know how...

Aha! That's the kind of thing I was waiting to hear. That's a
significant difference. I admit that I'm a lot more willing to pull
out a credit card than I am to send a check and letter, particularly
considering currnency exchange hassles. But I wonder if taking
mastercard/visa costs money? I assume it does, and if it's not a
trivial cost then it makes it hard for the poor shareware author to
justify until he/she's already gotten a goodly number of
registrations.

In article <1fhobnINNjvq@life.ai.mit.edu>, dmb@xbar.ai.mit.edu (David Baggett) writes:

>So what did everyone choose instead of Blox? Really, I'm dying to
>know.

Blox was an interesting game, but I don't play games much. It is in our club DOM library right now, but I can't tell you how many people have gotten that particular DOM -- and surveys of our user group tend to indicate that most users want graphics or 'productivity' software rather than games ...

I tested Llamatron out too, but, since I'm not much of an arcade game player either, it didn't appeal to me.

Neither game has received a shareware fee from me, simply because neither game got more than a 40-minute workout ...

I agree that the look of Blox is better, graphically, than the look of Llamatron ... but then I didn't see much of Llamatron. (If one does not get past level 1 in an arcade game, one doesn't get to see the 'nifty' things people tend to put into the higher levels.)

>I'll never really know why Jeff Minter made 300 times as
>much money off his popular-arcade-game rip-off than I did with mine,
>but I don't think it's entirely a matter of software quality.

Some quick guesses:

1. Jeff Minter is a cult figure in the European market.
2. He offered a neat poster and some other stuff.
3. LLammatron was hyped in the European media quite a bit.

At times I tend to believe that the ST software market is so small simply because there IS so much good PD/freeware/shareware software out there. I also think that it has something to do with the early lack of truly creative programs -- only now, after nearly 7 years on the market, are word processors really becoming fancier than ST Writer. Early attempts at being fancy were carried out by companies who could have used a bit more polish in their software offerings BEFORE announcement.

Atari, the company, has made a number of tactical blunders. Their first was sitting on GDOS for so long... Of course, where were the young entrepeneurs willing to write their OWN GDOS-like program (complete with fonts for all screen resolutions and popular printers) to sell cheaply to the masses? People stuck with Atari's version of what a graphical output system should provide rather than taking a look at any of the many other options (including the use of BitStream fonts and technologies).

How many programmers out there wrote to Borland offering to write up a version of Turbo Pascal for the Atari ST 'on spec'? How many programmers out there wrote to Lotus? Ashton Tate? Everyone is fully prepared to blame Atari for the problems, but no one was willing to take the risks that the 'original' software companies (you remember, those who wrote software for the then-emerging IBM PC ... the one's who later turned things into multi-million dollar companies) took to try something new or to port something not so new?

Now then, think about all of the software which HASN'T been written for the Atari ST ... yet. We don't really need yet-another-disk-defragmenter, or yet-another-archive-utility, or yet-another-pacman-clone. What we DO need are things like: a really good text outline package (one that exports into the popular word processor formats), a really good CD-ROM interface (the data on most of the PC CD-ROMs is textual in nature, and the graphics are suitable for CGA/EGA, and, hence, Atari ST, screens; who's written to the CD-ROM makers offering to write these interfaces for a 'piece of the action'?) ... take a look at the programs offered at your local PC Software Emporium and start thinking about how you could create something similar for the Atari ST.

Once you've got the idea, stop thinking about PD/freeware/shareware and begin to think commercial software. Heck, if enough people were willing to put up the effort, I'd even consider starting up a software house for the distribution and sale of ST/STe/Falcon/TT-oriented programs.

In article <1992Dec2.132806.10544@nt.com>, Gerry O'Rourke writes:

>Can somebody please post a short description of what Ghostscript actually is.

Ghostscript is a PostScript interpreter. It will read a PostScript file, interpret the page description commands and create a page/screen image of the page as described in the PostScript file. It does essentially the same thing that the commercial PostScript interpreters do. The latest version is 2.5+, and should be in the Newitems directory of the atari.archive server. A screen-oriented viewer is also available. You will need to obtain the Ghostscript font archives as well. They are in Gnustuff/Tos/Ghostscript.

The output of the ST version of Ghostscript to an HP DeskJet was acceptable, and the monochrome screen output was also good. The latest versions may also be able to direct output to a color monitor, but I haven't tested that yet.

>curious to know what the problem is.

Why the _HELL_, as of a few weeks ago, is "End of the Road" by
teeny bopper R&B group "Boyz II Men" THE NUMBER ONE song of the
entire rock era in the United States. I honestly never heard
this song until last night (never heard it the whole time it was
sitting at the top of the charts) and I was bowled over by its
mediocrity. I am completely amazed.

On the PC there is a game called Wolfenstein 3-D. It is something
which has been done before, often better (remember MidiMaze?).
The concept was ripped (with permission) from a classic Apple II
game, most of the fundamental principles of which weren't even
carried over to the 3-D version. There is absolutely no randomness;
a pre-recorded sequence of keystrokes could be used to win the game.
And now the kicker: Wolfenstein 3-D is probably the biggest action
game of all time on the PC. There were thousands of orders even
before the commercial version of the game was completed. I have
even seen it on the TV news. I don't mean to say the game is
completely without merit, just that it certainly isn't worthy of
all the fanatical praise being heaped upon it. Other shareware
games endlessly clone each other and pull in serious (five figure)
amounts of money.

I guess my answer is: I just don't know. There is a long history
of lousy or medicore products becoming successful while some real
gems slowly rot away. People are weird.

>flinging around don't even include the 486 chip!) for about $1100.

486-50 motherboard, with CPU: $990
Source: PC Sources, towards the back, November 1992. Can look this up
if you really want the name of the company.

>So - people are complaining about the non-upgradability of a nicely designed
>closed system (the Falcon) while ignoring the fact that upgradability for your
>current (non-ST) system costs as much as a brand new Falcon, or more!!

Not true. See fact above. This is the main thing that has changed
since the ST came out. Upgrading PC's is ludicrously cheap now. Hope
you never get tired of the Falcon's video modes, because to change them
you'll have to buy a whole new machine. This is a by-product of
Atari's stupidity (yet again) in making the video subsytem a closed
component. Unlike on the PC, where if I want accelerated 24 bit color
with a TI34020 graphics co-processor, I can just stick a board in.
(For less than a thousand dollars, mind you, even for the
top-of-the-line Number 9 boards.)

>And how far could you upgrade a typical Apple][?

Amazingly far, compared to other machines of its day. If you got tired
of the video modes in your Atari 8-bit, tough. But there were several
boards for the Apple that improved the resolution and number of
colors. Don't get me wrong -- I *liked* my 8-bit. But it was doomed
to fail after a few years because you could never extend its
capabilities.

>The "upgrade" to a full-blown Falcon won't have cost me any more than the
>purchase of a //e cost me back in 1984. It also won't have cost me any more
>than the purchase of a (now-defunct) 386SX in 1992.

I'm glad you put upgrade in quotes there. (Sorry.) More on your claim
in a moment:

>Upgradability is fine if you have the money. For every microcomputer
>system with which I am familiar only the Atari ST is inexepensive enough in the
>first place to make the purchase of a BRAND NEW MACHINE less costly than an
>"upgrade" to a new CPU for those other machines.

This is completely false. You could by a brand new 386-33 motherboard (with CPU) for a couple hundred bucks, pop it in your 286, and away you go with a more powerful machine. Hardly the cost to "upgrade" to a Falcon (which is probably about as fast). Provided you have even a lowly monochrome XT, you can move to a complete 386 VGA system for less than the cost of a Falcon. The fact that the case, power supply, drive bay sizes and placement are standardized DOES make a difference. Even when you have to rip out the whole motherboard (which will less commonplace these days with clock-multiplying technology), you *still* save money because you get to keep the old IDE card, hard drive, keyboard, power supply, disk drives, etc.

>Those with external hard drives haven't lost anything in the transaction --
>they can still USE those external hard drives with the Falcon. They can still
>USE those printers and external modems with the Falcon. They can still USE the original monitors that came with their ST. How's that for "upgradability"?!?

It's great that you can use those things. SCSI support makes the Atari have an open architecture for drives. If the system were closed, and your ST drives couldn't be used with the Falcon because they were nonstandard, that would be bad. You're agreeing with me here.

But this kind of upgradeability isn't enough. You're forever stuck with the video modes you start out with, the cpu you start out with, the DSP you start out with (with no chance of putting a more powerful one in later), etc. Because those aspects of the Falcon are closed, you'll be stuck with them forwever. And that's why the Falcon is doomed to at most a 3-5 year lifespan. (Assuming it's released before Atari goes bankrupt, that is.)

If people could right now by a $100 card to plug in their ST's that would give them a 256 color 640x480 video mode, how many would? Lots. Tons. Games wouldn't even bother supporting the lame old 16 color modes. But this dream scenario will never happen, because the ST's video hardware is soldered onto the motherboard. It's a closed video architecture.

Then why did you "upgrade" to a computer? Did you feel that you had to have the "latest and greatest" thing? I suspect rather that you wanted to do things faster than before, and that since the technology was available, you embraced it.

We are foolish if we feel we have to have the latest and greatest for its own sake, but we are more foolish if we refuse to use new technology out of stubbornness, or refuse to buy computers into which new technology can be easily intergrated and instead choose ones that we must throw away when we tire of waiting so long for them to finish their tasks.

^^^^^^^^^^
Yikes!
> Dec. 19.
> --
> Juha Kuusama
>

Hmm, I guess from this we can conclude that the Falcon with 56001
at 32 MHz is a steal for $800, wouldn't you say? Unless this guy is
way off base and should be selling his card for $500 or something. :-)
I know I wouldn't mind getting a $2500 extra in my $800 computer. heh

>You can run Windows applications under OS/2. Hence, software exists
>for that GUI.

Actually, the software isn't written =specifically= for OS/2, so it doesn't
'exist' for that GUI. It's sort of like the argument "You can run Macintosh
software on an ST with an emulator card, hence, software exists for the ST."

>You can run X applications under 386 mach (with Unix emulator). Hence,
>software exists for that GUI.

Most of the X applications people talk about are trivial. Those that are not
may, or may not, run on a 386. Ask any software house that's ported
their whiz-bang application between a Sun workstation, a DECstation and an HP
workstation about portability... then ask them if their product runs on your
386 SCO UNIX box with X11R5.

>There you go -- three choices, all of which support as much or more
>software than will run under GEM on the ST.

Of course, one can run Windows on the ST using an emulator, and one can run the
Macintosh GUI using an emulator, and there's GEM as well ... three choices, all
of which support ... you get the picture.

>Only if you NEED a useless paperweight in 10 years is a closed
>architecture worhtwhile. What's WRONG with an expandable machine?
>How is a closed architecture BETTER? Don't say they're cheaper,
>because they're not anymore.

Depends upon what you mean by 'closed architecture'. The SparcStation ELC in
the next room is, essentially, a 'closed architecture'. It has everything the
average workstation user considers necessary in a workstation -- and what it
doesn't have for peripherals, it can obtain through the standard SCSI bus.
On the other hand, the Sun 3/60 in the next room was an 'expandable machine' at
the time of sale -- you could purchase it without networking capabilities, and
it didn't necessarily have a SCSI controller card when purchased. It is a
useless paperweight after only =3= years!

>Yes, but will it satsify your needs in 1999, when ISDN is ubiquitous,
>terabyte writable storage is common, 500 mips computing is typical,
>etc.?

A new computer designed specifically to take advantage of ISDN, 500 mips
computing and terabyte writable storage. A 486 running at 33 megahertz isn't
going to cut it, even if you update the motherboard a hundred times while
keeping your current cards. (Hint: Does anyone REALLY want to use the disk

drive that came standard with an XT purchased in 1985?!?)

>In the long run no one stays satisified with a closed architecture.

Most UNIX workstations build today are, essentially, closed architectures. Networking, memory, CPU, SCSI interfaces, audio output -- they're all build on the board. They become expandable because of the number of devices you can hang off the side. LOTS of people are satisfied with a 'closed architecture'.

>You could argue that in 1900 you didn't have a phone, so you certainly don't
>need one now.

Funny how, for all the advances in phone technology, the standard design of the telephone still remains the same. It is, essentially, a closed architecture. The peripherals hanging off the side (answering machines, PBXs, fiber-optic and satellite links, etc.) are what have expanded the telephone.

>And once I have the Falcon? (Which, with a 16Mhz 68030 is already
>obsolescent.)

So, Dave, when are you going out to purchase that DEC 3000 Model 400 AXP Workstation. After all, it is on the 'cutting edge' of processor technology, being a 64-bit RISC architecture. It's even expandable!

Any 32-bit technology is now 'obsolete' too. I doubt that those purchasing 486-based machines are going to believe that their machines are already obsolete, even though they are.

If software appears that is useful, even a 16Mhz 68030 is far from being crippled or dead-on-arrival.

-- David Paschall-Zimbel, who is currently typing at an "obsolete" VAXstation 3100 with more compute power than the ZEOS-486 on the desk 12 feet away.

Oh come on Dave, they may be worth $200, but they do cost more than that!

When someone posts a cost analysis of a 386DX@25MHz, with DSP board
eqivalent to a Falcon's DSP, VGA, serial, parallel, 4 games ports,
SoundBlaster Pro, and Windows, you'll have something that almost
sizes up to a Falcon 030. Not in price though.

>heard why people like closed architectures are totally religious.

Just so we don't let Dave railroad a wave of opinion, the last time
the argument went through, the biggest PRO-CLOSED architecture point was:

DEVELOPERS KNOW WHAT THE MINIMUM MACHINE HAS.

Some programs use SoundBlaster. No programs use PC-clone DSP boards (and
wont for hundreds of years).

Many programs are crippled to allow them to run on 8088 machines (ie. don't
take advantage of 386 power).

Yet new Falcon programs will be 030 specific and use the DSP if useful,
and have the best sound of ANY home/personal computer.

They will assume 1M minimum, and more advanced programs will assume 4M
or 14M.

>a good idea. And it is very infuriating to an author when someone says
>"Your book sounds great, I'll get it out of the library" when that
>author's living below the poverty line.

On the other hand, libraries are often the only places where large numbers of sales are made for non-fiction books ... library purchases account for a large part of revenues for publishing companies, and they realize it.

I don't know too many authors, but I know a lot of readers, and the author should be GLAD that a reader is going to get a book from the library -- as it means the publisher has made a sale to the library, whereas he would probably NEVER have made a sale to that particular reader. For the writers I do know, finding someone is interested in your writing (despite WHERE they obtain a copy of your writing) is a GOOD THING.

>Considering that perfect copies of software are trivial to make, I'd be
>willing to lay huge odds that a widespread equivalent to the public
>library for software would destroy the software industry, utterly.

Why? As you say, copyrights still are in effect. MicroSoft and Lotus have made no bones about suing companies which copy software -- regardless of whether they got it from the library or by purchasing one software package and then making 500 copies.

And, of course, software houses would be making large amounts of money from the library purchases. You did realize that libraries generally pay MORE for their copies of books and magazine subscriptions than you do, right?

>One further comment on the library analogy (since it is an illuminating
>one): My experience is that most new books you'd actually want are
>virtually unobtainable from libraries. It seems like books don't hit
>the stacks of Anytown Public Library until several years after their
>release,

You must live in a non-metropolitan area. It's my experience that many new books hit the stacks months before I can afford the (now not-so) cheap paperback edition. I generally find books of interest listed in the book-club newsletters which I then go on to read via the public library (the Minneapolis Public Library system also checks out software -- or at least they used to do so..) If I find the book useful, I purchase it. If it's trash, I haven't lost anything except my time and a bit of the local taxes I pay each year to maintain the library system.

New books generally arrive at the same time as they are released publicly. The reason you don't see them in your library MAY be the amount of time it takes to process the order/add them to the computer. Then again, your library system may be underfunded ...

Sorry to take so much time, but I think Dave has a non-accurate idea about what libraries do, and why they make books available in the first place. (Hint: It's NOT to rook deserving authors of profits they might obtain by sales of books not available at the library.)

>It does! :)

Really? Well, have you ever used one? Ever seen one? What about it
sucks? You were just a tab bit vague. If you are going to reply that the
Amiga xxxx is far superior, please don't. I know people that are
seriously considering the Falcon that currently have Amigas instead
of getting the 4000. But they are keeping there options open, if the
Amiga is going to have ULowell programmable resolution graphics card,
then perhaps I would go with the Amiga instead. I think the argument
Amiga is better than Atari and Atari is better than Amiga is
irrelevant, why don't you concern yourself with the advancement of
both machines and companies. Bashing one another isn't going to help
either company grab any of the market share from IBM compatibles. Or
if you still have an 8-bit mentality about this sort of thing keep
your postings to your newgroup where you can sit around and giggle
while those people posting in this newsgroup can get some serious
work done for the betterment of the Atari user base.

Stephan

>>I've heard that the TT as well as the Amiga 3000 is too slow to run Unix with X.
>>Well, all I have to say is, look at the Sun 3/50 (68020 at 16Mhz) and Sun 3/60
>>(68020 at 20Mhz) running Unix adequately. I don't think any of them had X, but
>>for crying out loud, they ran Sunview. These Sun's were about all we used here

At the Chicago show I saw a TT running the unix. I asked them if they minded if I messed around for a while and they said no. Hell they even let me use the machine as 'root'.

My impressions were that the X windows was reasonably fast...certainly much quicker than running mint and toswin on my ST. No, the TT isn't a speed demon for Unix, but it is a very viable system. The sun 3 was no quicker and was used for years. By the way, sunview runs much more quickly than X on _any_ sun, including SPARCs.

If atari would only sell the Unix at a reasonable price, I would buy a TT today. I don't know how much their royalties to AT&T are, but I know that I won't pay $2700 for the software and a drive. I can buy a complete unix such as a NeXT (including the 68040 workstation) for $3500, so why should I pay so much for an Atari Unix. Everyone knows that Atari users are cheap. That is the market atari targeted--power without the price. We hate spending money. I don't know what a reasonable price for unix would be, buy I can't see the average user spending more than $400 for the package.

As long as they have the Unix completed, why not sell a few TTs by giving the Unix out on tape for cost of media plus royalty, instead of leaving it on a shelf. Naturally, they couldn't offer docs and support at this price, but neither does Sun with their basic right-to-use license. Third parties could offer support if they so chose.

I for one wanted a TT with unix. Now that they've spent the money developing it, they have nothing to lose by selling it at cost. Come on Atari, you can make money on the hardware, which is more than you are making by not selling it at all!

> It does! :)

Interrogatory: Do you have first hand experience?

OR

Did you just use up your last brain cell?

I own both an Atari ST and a TT. I have owned an Amiga 1000.
They are all good machines. The ST was better at getting the
job I needed done. I needed money, so the Amiga 1000 was sold
at a huge loss. Now the software for the Amiga has surpased the
software for the ST, for the most part.

However I also recognize that the OS plays a great part in the
perceived speed of the any system. Atari's TOS, while not the
worlds greatest thing, does a very respectable job of getting
the job done. GEM provides a, IMHO, cleaner more professional
appearing desktop, than comes with the Amiga. And with the desktop
replacement NEODESK it provides the best desktop.

Now does the Falcon suck? I haven't used one so I can not pass
judgement. But its fan does suck air. 8^)

I PROVED previously that PFX-Pack will pack accessories!! I have over 800k of compressed accessories (with PFX-Pack) stuffed onto one disk, taking up only about 500k now!! They ALL work fine! (Apart from the ones with naturally crash when you try and run them with another accessory which tries to do what the other one is doing).

Dc-Squish will do ACCessories & Programs quite happily. If it got better compression, and didn't display that 'DC-Squish' message when it was depacking, I'd use it, because it has a nice batch compress mode (*.PRG will pack ALL files ending with .PRG) whereas PFX requires files to be packed seperately!

Don't ALWAYS listen to what everyone tells you. EXPERIMENT!!

>eqivalent to a Falcon's DSP, VGA, serial, parallel, 4 games ports,
>SoundBlaster Pro, and Windows, you'll have something that almost
>sizes up to a Falcon 030. Not in price though.

This may be true in Australia (not being facetious here), but it's certainly not true in the US. You can get a 286 with everything you listed above (apart from the DSP) for about $750 *including a monitor*. (Weren't figuring a multisync monitor in for your Falcon?) If you want a 386, add $185 for a 386-33 motherboard. If you REALLY want me to, I'll post Actual Real Prices from this month's PC sources.

I have no idea how much an equivalent DSP board for the PC would be, but I can once again point out that if I decided instead to get a TI34020 accelerator instead the Motorola DSP, I could do if I had a PC. But not if I had a (more expensive) Falcon.

You are a morbid bunch out here aren't you. DC goes away and
you would think a relative died.
To be a bit more optimistic about it the ST software is going through
a "restructuring". In the past 6 months the two largest ST music software
publishers also have "gone away". This of course means thier assets were
bought by someone.
I own a few Hybrid Arts products and aftter the initial shock of
finding thier phone no. unhooked I got hold of the new owners and got a bug fix
I needed. They seem quite committed to supporting the products they aquired.
C-Labs produsts have also been taken over by someone else. I am sure there are
other examples out there.
The people who have aquired these products (and in some cases the
software writers connected with them) obviously feel they can make money. In
fact, if they the price is right thier debt load could be lower than the
original companies, hence more profit per copy sold.The people selling
these products rights obviously feel they big numbers are past and it's time
to move on.
I would say that yes the ST software industry is getting smaller but
it will be around for a long time yet. New products will be scarce in the
retail market but there is a good base of mature software out there. Much of
this doesn't affect many of us who use thier ST's for one thing (ie music)
I just don't think it's time to start the funeral yet...

Wayne Felske My wife is a music computer widow.

Oh, please! I *do* know freelance authors (my mother, for example),
and I *know* what the sales are like, and this is utterly incorrect.
For nonfiction popular titles like cookbooks, the major sales come from
book clubs like Better Homes and Gardens and from chains like Crown,
Waldenbooks, and B. Dalton. Libraries don't even figure in to the
publisher's calculations, they're so insignificant.

The only situation in which I imagine what you describe could be true
is for very highly technical textbooks. And there you're talking about
things that sell no more than a few thousand copies. (I.e., basically
charity work anyway.)

>For the writers I do know, finding someone is interested in your
>writing (despite WHERE they obtain a copy of your writing) is a GOOD
>THING.

Hey look, we all gotta make a living. As if I need to keep repeating
this. Joe Novelist may be think it's Just Keen that you like his book,
but if you aren't willing to buy it he'll just starve or quit writing.
Even Shakespeare didn't write for free -- he wrote for the theatre, and
got paid doing it, and wrote stuff that would sell well. I guess
people who think that software or books aren't worth paying for
wouldn't take it too bad if Shakespeare were a carpenter instead.

>>Considering that perfect copies of software are trivial to make, I'd be

Yes, but we all know how enforceable software copyrights are in practice. Microsoft doesn't monitor the computers of the millions of people that are running pirated copies of Word, so they just lose the money. Copylefting everything, or creating public software libraries, would just serve to magnify the existing piracy problem to the extreme, UNLESS software starts getting made that is somehow uncopyable. I don't see how this could ever be achieved, but who knows.

>And, of course, software houses would be making large amounts of money from the
>library purchases. You did realize that libraries generally pay MORE for their

You have a misconception about how much a role libraries play in terms of sales. As far as I know, the claim that libraries pay more for books than you and I is also false. Do you have any evidence that suggests this is the case?

>You must live in a non-metropolitan area.

Oh yeah, Boston. The boonies. Don't mind us rural types. :)

>If I find the book useful, I purchase it.

Gee, this sounds just like the idea behind shareware. And we all know what an utter failure *that* idea was (for the majority of authors, at least).

>Sorry to take so much time, but I think Dave has a non-accurate idea about what
>libraries do, and why they make books available in the first place. (Hint:

Fact: libraries make authors virutally NO money, but they cost them an enormous amount of "end-user" sales. Whether or not they are good for society, they drag down the profitability of the publishing industry (which is currenty in bad shape).

Source record: 213889

There has been some "flamage" on the "evils" of the copylefted software. I suspect that some of it comes as a result of the fact that there have been many things "read into" the copyleft philosophy.

Remember what the concept of copyleft was designed FOR. It was made up when some people found that there were some programming TOOLS that people kept having to re-invent because of copyright restrictions.

Programmers LIKED the Unix system, and the C language, and a number of the surrounding paraphenalia. Unfortunately, even though it is quite well understood (i.e. - not novel), people have to develop things like compilers and OS kernels over and over again for new computer architectures.

I'll just talk for a bit about C compilers, and leave generalization to others :-).

What happens as a result is that people keep "rewriting the wheel." And when a new computer comes out, there's been two choices for the manufacturers/programmers:
1) Pay a company to build a compiler (ala Microsoft/Borland)
2) Brew up a compiler from "scratch"

Both of these options involve paying out a fair bit of money. In the first case, a "Microsoft" is paid quite a sum for the virtue of having internal expertise in compiler writing. Some would argue that it's an immoral sum of money, but that's getting excessively political. A "bigger" problem is the fact that you suddenly find yourself dependent on the continuing existence of "Microsoft," and their good-will towards you.

In the second case, you get a compiler that is unquestionably yours; you don't have to depend on any other company to maintain the product, and there are no royalty fees (or if there are, it's out one pocket, and in the other). There's no restrictions; if there's a bug, and you have skill to find it, you can fix it. Unfortunately, the cost is pretty high. Dave Baggett can certainly attest to the cost in time and effort in writing his set of libraries.

A particular problem with compilers is the fact that an internal developer will have to build up expertise that involves both a creation of original material, as well as quite a bit of "wheel re-invention." The original part is clearly necessary; the "wheel re-invention" is costly, and theoretically unnecessary.

Here is where something like GCC comes in as valuable. The front end describes the parts of a C compiler that are relatively common to ALL

implementations. Parsers, tokenizers, and the like. The part that amounts to "wheel re-invention."

The code generator will be unique to each implementation, and clearly requires "original" work.

The existence of GCC provides a third option:

3) "Borrow" a front end, minimizing the amount of work needed to create an "in-house" compiler.

Certainly this means that GCC will injure software houses like Microsoft that are in the business of "re-inventing the wheel" (quickly and efficiently, I will grant because they've got experience and old code. But you certainly pay for that re-invention!). The aggregate of the programmers that have contributed to FSF software probably adds up to a body close in size to a company like Microsoft.

But, and this is an enormous "But", GCC isn't a final user application. In fact, relatively few of the FSF programs are "user applications."

Most FSF programs are software tools. There's a few games, but most of those are quirky things that are oriented towards computer "nerds" as opposed to Jeff Minter's proverbial "Darren." (A 14 year old Amiga owner that wants a new computer game each week. Not being made of money, he pirates them. Many of them are unoriginal rehashes of what was done last year, as opposed to labours of love, and so resemble the "wheel re-inventing" of the compiler world, but I digress...)

They haven't killed Microsoft; they probably HAVE been good for programmers in general, because the existence of a lowest common denominator like GCC/GNU Emacs/Perl/... means that people who want to make REAL money have got to make a fundamentally better product.

Companies used to exist simply to make "basic compilers." That's probably a dying breed - they have to play smarter in order to survive.

Here's a few things that are missing in the FSF world, that others have been quick to exploit:

- Application frameworks (simplifying the use of all of this GUI stuff)
- Advanced debuggers
- Object management systems
- Better libraries (Game Workbench could fall into this category :-)).

Some people seem to have taken the copyleft as a way to demand that ALL software become free. That's unreasonable to expect, and even those that most strongly promote the FSF and copyleft recognize that.

I suspect that the ones that tend to get heard from more are the pirates that just look at it and say "ooh! Free software! You mean I

don't have to pirate this, like I usually do?!?" There's a lot more
of these than there are of those that actually thought out the idea of
"copyleft." Neither copyright nor copyleft is likely to have any
significant effect on these people.

> ^^^^^^^^^^^^^^^^^^^^^^
>
>But I would MUCH rather have 3rd party application software that supports my
>DSP than have 'the ability to upgrade it later'. Please Dave, you need to
>quit ignoring peoples posts if you are going to try and argue with them.

OK, I will hereby NOT ignore your post:

Again, YOU will be stuck with the DSP you start out with in your
Falcon. *I*, by plugging in a board with a DSP on it, can toss the
puppy in the trash as soon as I need (or -- gasp -- want) more speed
for my applications, more features, a more powerful or
application-specific DSP, etc.

As for "3rd party application software" what do you think is going to
support the DSP in the Falcon? You really think Atari is going write
dipsquat for it? They can't even support the CPU's in their machines
with good software, much less write wares for special coprocessors.

I got a major surprise for you: there are about 10,000 times as many
commercial developers for the PC line than there are (or will be) for
the Falcon. If you buy a DSP board for the PC, you'll get *plenty* of
software to support it. At the worst you can write your own, which is
what you're going to have to for the Falcon as well, from the way
companies are continuing to bail out of the Atari Titanic like rats.

Not to mention that we've yet to see anything but vapor out of Atari HQ
on the whole Falcon matter. I've had the special priviledge of
actually touching a functional Falcon prototype. (Oooh, aaah!) Most
Atari users haven't even gotten that much, and you're already defending
the thing with this kind of zeal?!

>In other words make a counter point to the argument I (and many many others)
>just made, instead of spewing out 100K of the same caca you've been giving
>us all along.

You're really taking this hard. Perhaps you should consider how much
such arguments will matter to you when you're 80. (That helps me a
lot.) I have specifically addressed, line-by-line, every post I thought
gave intelligent, favorable arguments for close architectures in this

thread. You just don't LIKE what I'm saying.

>Better yet, since you love your P(iece of) C(rap) so much go
>annoy some people on some of the PC newsgroups cause I (and many many others)
>have read this stuff enough times already to start typing it in for you.

You've also read the 40 page long Picture Formats list; the dozens of posts I've put up here about sample playing; the hundreds of posts I've made giving people help with ST programming, general advice, moral support in their programming endeavors, helpful info about how to install things like GCC; etc. You are sounding like a fair-weather friend. As long as I post uncontroversial, meek little technical messages, you're all for my staying here, but as soon as I even *suggest* that your machine or future Atari machines may have deficiencies (speaking with the experience of an uncountable number of hours of progamming for everything from the ST to the Falcon), you tell me that my presence here isn't wanted.

>P.S. No wonder you really don't have the time to make games or workbenches
>anymore (every time I get to one of your posts I see 'more 13%' (or worse)
>wether it be the subject 'Closed Architecture blah blah blah' OR 'Why Hasn't
>Anybody Sent Me Money blah blah blah').

First of all, my ability to write quickly, clearly, and voluminously is something I'm not ashamed of. Though it's really irrelevant, the amount of time I spend on Usenet is *nothing* compared to the amount of time I spend on "real stuff."

Second, I guess I should have never said anything honest, never admitted I felt a bit taken advantage of, but instead pretended to be happy with what the Tramiels have done to a once-great company that *used* to make innovative and viable products.

Thirdly, dammit, I don't CARE if you don't send me money, but DON'T expect me to keep putting 10 hours a day into helping your community for absolutely nothing. Heck, I admit it -- I'm not a god, I'm no superman -- I have to pay my rent, buy food, etc. like everyone else. You're asking me NOT to tell the community that there are *problems* with the shareware concept; that there are *problems* with a market that can't support more than a handful of commercial outfits. Perhaps there's nothing to be done about all this, but that doensn't I should say anything about it. Maybe we can all *learn something* by looking at what Atari has done wrong -- there's probably at least one future computer company owner out there.

Except for the first three lines, your entire post was an ad hominem attack. (Not that I didn't enjoy it, but still.) Hardly exemplary in terms of critical thinking or rebuttal, yet you criticize me for what you giving what you claim are arguments with no support. I find that a bit ironic.

>Oh, no offense.

None taken.

6442. Where's the Bus? (was Closed Architectures Considered Harmful)

Newsgroup: comp.sys.atari.st
Date: 1992-12-04 01:00:07 UTC
From: cbbrowne@csi.uottawa.ca
Message-ID: <1992Dec4.010007.8819@csi.uottawa.ca>
Source record: 213890

The question of what "closed" means is getting more and more difficult to answer as time goes on, because new technology is opening things up.

The presence of things like a SCSI bus makes the "open-ness" of the CPU bus less and less crucial. Here's some questions that might clarify things.

Is a Falcon going to be more "open" by the addition of:
a) A built-in VME card slot, or
b) A built-in SCSI bus?

As SCSI gets more and more ubiquitous in the workstation world (and seems to be making inroads in the "Intel Inside" world), it may become the "bus of choice."

What's more profitable?
a) Sell devices on cards that can only plug into ONE particular system architecture, and write machine language drivers for each such system, or
b) Sell devices that plug into the SCSI II bus, for which drivers are probably easier to write, that can plug into 25 different CPUs?

Change the term "SCSI" to "Ethernet", and things don't change much. On networked systems, the presence of a parallel printer port is becoming less and less important. I've got a PC in my office that is regularly used to print documents, but will probably NEVER use its parallel or serial ports during its lifetime. Apple's AppleTalk networking system was a stroke of genius that made up a lot of ground for the "defect" that the systems weren't easily expanded internally.

I would suggest that things like SCSI and Ethernet are becoming the "busses" of the future. They may not have the same level of performance as a direct CPU bus, but are quite adequate for many purposes. The fact that they can be used on a variety of computer architectures means that they can provide CHEAPER access to special hardware. This can in turn allow the performance of BOTH ends to get enhanced, so that there may be no loss in performance in the long run.

What product would you rather see come out next month:
a) An Atari specific Genlock board that assumes a Motorola 680x0, and will only be supported by a few manufacturers, or
b) A Genlock device that can be connected to a SCSI bus?

b) may be a little slower, but it will be both cheaper, and have more support, because 3 months from now, someone will release a beta source edition to some design software written for a Sun. Even if a) was

changed to "a VMEbus board", b) would still be better.

6443. ACC Memory Allocation Was Re: Lha Files

Newsgroup: comp.sys.atari.st
Date: 1992-12-04 01:08:09 UTC
From: cmedley@wam.umd.edu
Message-ID: <1992Dec4.010809.9328@wam.umd.edu>
Source record: 213885

Actually, if PFX is malloc'ing RAM for the decompressed .ACC, then it is ok, as i understand it, as long as it does this before the .ACC does it's first event_??? call because the memory will be associated with that .ACC correctly. After that, it may not be identified with the .ACC, but with the current running application.

There are ways around that using the P_RUN variable. The acid test for all of this might be to see if the PFX packed version can be loaded in to MultiDesk or some other ACC loader.

On a related topic.. Does anyone know how the Atari CPX Panel handles keeping some CPX modules in memory and others on disk? Apparently it allocates enough for some of them, but not for all... how does it load them in? Is it caching the CPXes?

>For home applications at least, even the peripheral advantage is
>disappearing. Many useful peripherals are now available with SCSI
>interfaces.

Well put.

Direct access to the system bus has made it easy to hack up hardware modifications; witness the proliferation of literally dozens (I'd say "hundreds," but risk hyperbole) of video boards on different varieties of PC clones.

Each video board is a "custom" application that can typically only run on one sort of PC. And it requires Yet Another Video Driver. Since MSDOS didn't give a convincing video interface, it means that there's either OS hacks to pretend to integrate the boards, or software packages need to be "video smart." Quite the ugly situation.

The entry of interfaces like SCSI that provide a high speed "bus" that is truly CPU independent may start to solve the problem.

Most of the applications for which people add boards to their PCs are not applications that intrinsically require access to the system bus. "Internal modems" are a clear example of this.

There's a standard that seems to be "up-and-coming" for low speed (80Kbits/s) connections for i/o that could be the lo-cost little brother for SCSI; check out the DEC ACCESS.bus. They suggest using this system to "network" things like keyboards, mice, joysticks, graphics tablets, modems, printers and image scanners. For typical PC use, this sort of speed should be quite adequate for these sorts of devices. (I've got a data sheet on it if anyone's interested).

>That you can't use a CD-ROM with an ST is not a hardware
>problem; ACSI-SCSI devices have been around for > 5 years, but noone
>has written code to use one of the many available SCSI-CD-ROMS, or
>SCSI-ethernet boards. The problem is a dearth of software, not the
>architecture.

Actually, it's a pretty general problem. There's a number of PC vendors out there that have built host adaptors, and the drivers all seem to be mutually incompatible. Corel Systems (here in Ottawa) is

trying to get something going in terms of popularizing SCSI in the PC world by making a more compatible interface. But it's not just Atari that's been having problems with CD-ROMs. (Just check out Chaos Manor. Jerry can never get two different CD-ROMs to read properly on the same PC, it seems!)

>with a TI34020 graphics co-processor, I can just stick a board in.
>(For less than a thousand dollars, mind you, even for the
>top-of-the-line Number 9 boards.)
Ok assume you did this, now you write a game for your machine. If you use
the TI processor you can write a nicer game, but your targetted audience
has just diminished amazingly. Won't you be more likely to write for a
reasonable common denominator like ususal boring VGA ?? So that your game
doesn't laaag when you play it on a non TI System ?

(Seems to me most MS-DOS software in existance today still runs on a 8088.
That's keeping the 486 in first gear.)

>with the video modes you start out with, the cpu you start out with,
>the DSP you start out with (with no chance of putting a more powerful

>you'll be stuck with them forwever. And that's why the Falcon is
>doomed to at most a 3-5 year lifespan. (Assuming it's released before
>Atari goes bankrupt, that is.)
Quite frankly I don't care. If you need higher CPU performance, there
will be no doubt speed enhancers coming out.
As for the rest, do I want a new DSP when the software will be written
for a 56001 ? Do I really need something better than SCSI-2 for the Falcon
in the next 10 years ? Aren't the videomodes the machine can produce
not already quite enough for the 16-bit bus of the CPU ? The Falcon040
if it's designed like the TT, will be the machine that you can stick
in your graphics cards if you want to. The F030 is the entry level machine,
like maybe the old Atari 8bit was, you bought when you were young. Did
you say after a year, gee the video modes suck ??

As an Atari user you don't upgrade your machine, but you buy a
new one, a lifespan of 5 years for a computer is normal.
(Given the fact that you then have TWO functional computers instead
of one, I don't mind purchasing a new one, instead of upgrading at all)
I rather buy something that is designed integratedly like an Atari, where
you have a base configuration you KNOW to be the common denominator, which
does have sound/gfx/dsp suport builtin, because the likelyhood
that any software purchased for this machine will actually USE those

features is that much higher. (Besides you have OS support for it)

>If people could right now by a $100 card to plug in their ST's that
>would give them a 256 color 640x480 video mode, how many would? Lots.
>Tons. Games wouldn't even bother supporting the lame old 16 color
>modes. But this dream scenario will never happen, because the ST's
>video hardware is soldered onto the motherboard. It's a closed video
>architecture.
Games with 640x480 a byte each ? With a 68000 at 8Mhz?? Har, har, get real!

Nat!

>to feed their children.
>
>Sorry folks, that's just not true..

I agree with you that people who write magazines need to eat too.
That wasn't my point. I think I made it clear that they could have
continued on with the Atari 8-bit coverage at that time, without
sacrificing much. As I said, back in the 'ole days, when TI stopped
making personal computers, Compute! continued to support the 99/4A for
at least another two years! The Timex/Sinclair (that tiny computer
with only 2K RAM) was not all that popular as I remember. Compute!
supported it for a while, maybe about a year or so. I assume after
some point there the T/S was discontinued. They even supported the Coleco
Adam for a little bit. They actually published one type-in program
for it. It was around that time when Coleco decided to discontinue
it, and Compute! stopped supporting it soon afterwards. My point was
that Compute! back in those days seemed to be dedicated to supporting
a make of computer while it could, even if the computer was just
marginally popular. When they decided on the new format in 1988, they
left out the Atari 8-bit users, even though the 8-bits were still
being made and were still marginally popular. This was out of step
with their tradition. I agree that at some point, perhaps in 1990 or
something, they would've had to discontinue support for the Atari
8-bits, but I think before that the 8-bits still had enough of a
market to justify some coverage in its pages.

My other point was that it seems Compute! has become just another PC
magazine, because apparently they don't really cover the Mac anymore.
It seems to me to be a PC-only magazine, with occassional coverage of
some computer like the Mac, but they don't have any part of the
magazine devoted to it like they used to. Now, the Mac is still quite
a popular computer as far as I've heard. Even if Compute! threw out
their old tradition of supporting every make of computer if possible,
I am still puzzled that they don't have a part of the magazine
dedicated to the Mac. Surely prices for low-end Macs have fallen

enough to justify calling it a candidate for personal computing, finally.

It has always seemed, however, that Compute! never gave much support to the Mac for some reason. Even after they made the change in 1988. Perhaps they have not perceived the Mac as a personal computer in the same vein as the PC or the Amiga. This can be rationalized because they didn't support the PC back when it was first introduced. They didn't start supporting the PC until 1984 when the PC Jr. came out.

Also, how popular or unpopular are Amigas these days? It seems to me that they should have some coverage in there, and I don't mean it in the sense of sacrificing a lot just to do that.

>Anyone remember "Compute II, the Single Board Computer Magazine"
>???????

>
>The result was that the OSI computers faded away from the market.
>
>And.. the magazines which had supported this aborted child of
>the computer revolution turned to other platforms so that they
>could continue to sell issues and pay their bills..

I remember seeing OSI and Ohio Scientific sections in Compute! magazine back in the older issues, 1981 and '82. I didn't know there was a magazine called "Compute II" however.

>Compute! is no different.. if no one but a tiny "hardcore"
>audience buys their magazines, then it's in their own best
>interests to dump the stragglers and go with a mainstream
>that WILL buy their magazines.
>
>Why is that so hard to understand..?

What you say above is not hard to understand for me. I am not advocating that they should focus all of their efforts on one small make of computer, so that only the hardcore people will buy it. Far from that. I'm saying why not make coverage in Compute! at least be proportional to the computer's market share?? I don't think that would accomplish what you're talking about above. I think they would still retain most of their current PC subscribers, while ADDING

subscribers who own Macs or even Amigas, if they chose to do so. I doubt it would cost them much to do that. As I have said above, it would be in keeping with their tradition to do that. I am also not advocating tradition for tradition's sake. Compute! became one of the strongest computer publications in the nation, because of what it did. It covered lots of different makes of computers, so no matter what computer you owned you could almost always get something out of it and still be informed on what was going on in the rest of the industry (unlike the computer-specific magazines of that time), and it covered them all equally well. You have to understand that there were not that many general computer magazines back then. Most were computer-specific. Some of those computer-specific ones are long gone, but Compute! rose above it all, by doing what most other computer magazines DID NOT do. It supported many different computers.

>Look at all the "Atari specific" magazines that have either
>completely folded, or have reduced their publication schedules..
>
>Do you want them to continue to print and mail a product that
>no one is willing to pay for, out of the goodness of their
>hearts..? What wonderful sacrifices you want them to
>take on.. and why..?

I am not advocating that. I am glad for the sacrifices some are making, but I would understand if they decided not to support Atari computers anymore if they were losing money too badly by doing that. The reason I can understand this is because of how unpopular Atari computers are here in the U.S. If they were more popular, I would say your theory would not be true.

>Why not look to the REAL cause of all the problems in the
>Atari market..?

No doubt. Atari bears the responsibility for the fate of its computers.

Actually, it will be associated with the desktop.

>There are ways around that using the P_RUN variable.

No there aren't. The P_RUN variable is documented to be read only,
and in fact it really WILL be read only in MultiTOS. The fact that
changing it happens to produce the desired results in some versions
of TOS is, in essence, coincidence. Don't count on it.

Bottom line: if you're an ACC, don't Malloc after any GEM calls.
If you want memory, make sure you have a static pool big enough
for whatever you're likely to need. If you really, really need
to Malloc after your first GEM call, you absolutely MUST free
the memory sometime in between the Malloc and the next GEM call.

Eric Smith

Exactly!

Some ACC's cannot be packed, because they often store their configuration
within themselves. Those without a config, or those that use external
setup files, all seem to work 100% (I've had no problems yet!)

>MF>Could someone tell me of a BBS in North America that:
>
>MF>1) Gets new files regularly.
>MF>2) Accepts LD callers.
>MF>3) Supports 9600/14400 BPS.

I am a remote sysop on one in Denver. Called RingWorld. 2400-16800bps on a USR DS. 670megs online, supports Atari, Apple, Amiga, and PC. on the Atari side it has the largest demo collection in north america. gets utils and every other type of file regularly, has LOTS of PCS pix toowo (since photchrome is like to 3.0 now... and has some GIF stuff, though not as good as doing GIFtoPPM |pnmscael -xysize 320 200|ppmtoraw...)

Also has LOTS of mods as well. my collection is slightly larger then RingWorlds (I have 33 1.6M disks packed, pending me going home to ul them...) has many other things as well. Run off of ///Turbo. no fees or nothing. LD accepted as well... even has special ratios for highspeed callers. (like 7-1 dl-ul compared to 3-1 for regular callers. So stick it somwhere at login)

The # is (303) 699-0402.

BTW the sysop of Ringworld is also the author of the American Gold Tracker (for the most part) It is to v1.2. I will stick it at a.a in a couple called AG12TRAK12.LZH if anyone wants to get it. It is a module player supports ST/STE and such. has jukebox and other features.

OK, so make it $150 and put a graphics accelerator on it. Regardless
of how you look at it, you can't have any *fewer* options with an open
system than with a closed one.

>the "bus of choice."

There will always be a broad continuum of devices that one may wish to attach to a computer system. SCSI, SCSI-2 and SCSI-3 are fine for the wide range of devices associated with "secondary storage" but cannot replace a primaryu bus like VME.

That is, SCSI is great for disks and printers and other "slow" devices but you can't be serious about putting a graphics display out there, or a tightly-coupled coprocessor. They're just two different classes of device, with differing performance needs. As technology advances, there will always be (at least) the dichotomy between slow and fast computing devices, the slow I/O devices and the fast computational devices. Sure, tomorrow's SCSI equivalent could put VME to shame, but the equivalent system bus will be even faster still.

Meanwhile, the Intel world still treats SCSI as a 2nd class citizen, and it shows.

Well, BSDI sells Unix for the 386 with full source for $1000, and that
code *isn't* bound by the AT&T license. Sad to say, I don't think $2700
is a very inflated price for an AT&T restricted package. I agree that I
wouldn't want to pay much more than a couple hundred for it, but it seems
the only way to have that happen is to build it from non-AT&T code. You
might see what you can do starting with BSD and Minix...

I thought as much as well, but for reasons I can't understand upon reflection,
it didn't work out that way. (I already asked for pretty much what you said.)
I think the royalty costs really kill it, royalties to AT&T plus royalties
to Unisoft on top of that for doing the port.

>things out of stone.)

Excuse me! GCC IS the preferred compiler for the following companies:-

NeXT
DEC (Ultrix on a MIPS DEC machine)
and several other hardware manufacturers.

GCC is as good (and better than some) commercial suppliers' efforts. Your
gripe is about the debugger... this is not a part of the compiler! What you
are describing is the user front end to the compiler and debugger... please
think before you write!

Using your analogy, the command-line version of Turbo C is a vastly inferior
product to the user front end, even though the front end uses the same
compiler underneath.

User interfaces to compilers are trivial relative to the code generation
side of things, it's the icing on the cake. Myself I would prefer a compiler
which was not pretty to drive, but produced good code (its primary job) than
one which looked all flash but prroduced cruddy code.

>want to scavage from your XT (including that slow 20-megabyte hard drive tha
>IBM used back in the dark ages, er, mid-80s).

...

That's cool David..!! Great to hear...!

Oh.. would you want to maybe post the address of the Atari
dealer you bought your Falcon from..?

There might be a few folks here who were on the verge of actually
upgrading their systems with products for sale in that nasty
Computer Shopper.. you know.. the ones with motherboards, drives.
memory, I/O.. silly little things like that, for sale NOW...

I guess the question is, do you want to "keep the faith"..
and go learn to do something else with your time, like maybe
take up mountain climbing, or macrame, or watching water
evaporate... or maybe you'd actually like to use your
computer for (dare I say it..?) computing..?

Those "dark ages" computers (brothers to the original 1985 ST)
can be take far beyond their original incarnations, easily,
painlessly... unlike their Atari brothers..

Unfortunately, time doesn't stand still like those in the Atari market
would like it to..

By the time the Falcon gets here, (really gets here.. like you
can actually buy one, and take it home with you, gets here),
those "dark ages" PCs will have moved on to another level of
evolution...

I don't know whether I've got a different version to everyone else but my
version of Llamatron works fine whatever I do. Normally I boot from HD,
in TT medium rez, all ACC's and AUTO's in place including MiNT and then
I just double click on it. It works fine... Maybe I'm just blessed :-)

Oh yeah, that's on a TT030/8-105 with UK TOS 3.05.

That reminds me, I must remember to register it RSN.

Hatari!

Usually you can start OXYD.PRG, and after the title-screen was shown, you can play the first level by pressing the left mouse-button. If that doesn't work, you either have a corrupted file, or you need the new Version of OXYD, called "general Edition" (also available for MAC, PC, NeXT...). This version runs in Colourmode on the TT, Falcon and ST and you can choose between english, german and french language.

If you have the new version, and F1 or pressing the left mousebutton does not work, then reply and send me a detailed description of your computer and what happens, when you start OXYD.

The author of OXYD is not available via Email, so I will give the errordescription to him.

> want me to, I'll post Actual Real Prices from this month's PC sources.

Remember also, that Falcon has MIDI and SCSI II. Falcon can use VGA
monitors, too. And the graphics are better than VGA in the Falcon. What
kind of board do you need in the PC to be able to do video graphics? You
can do it almost out-of-the-box with the Falcon.

> I have no idea how much an equivalent DSP board for the PC would be,
> but I can once again point out that if I decided instead to get a

>

Well, is there any software for your add-on? (Or what kind of
accelerator the TI34020-board is? Is it transparent?) Anyway, I am pretty sure
that (for example) many Falcon cames will have "enviromental" sounds and
ambiet sound spaces, since they can expect even the poorest Falcon owner
has the DSP. That was just one example.

Interesting...

So far we've heard from ONE person whose continued existance (ie: Eating) depends on selling his programs to the Atari market...

And one person who looks down upon it all from the vaulted "Ivory Towers" of what "Should BE" in a perfect world...

So.. anyone else out there who continues to try to feed themselves (or their families) from Atari programming..?

Or are all the rest of us just vultures, ready to jump on the dead remains of those who tried to support the Atari market..?

>it has no amphibious vehicles because it can go on land itself.

The above is true; in addition, the enemy carrier is an expert coward. It
won't come near an island if you're already there, and if you manage to
ambush it, it may wait around to try to finish what it was doing there, and
then will run away. When it runs, nothing can catch it, including its planes
or your missiles. The other problems with the game are that it takes some
time to get from one island to another, and that controlling the fighters is
not exactly like an accurate flight simulator.

However, I like the game despite these faults. As everyone else has said,
the graphics are great (if you don't mind brightly coloured fighters and
rectangular islands). The game is a nice mixture of strategy and action,
if you like such a mixture (I do). You have to build up your supply network
as well as figure out how best to attack enemy islands; and because the enemy
carrier cheats, you have to plan and execute a careful ambush. The craft at
your disposal are the carrier itself, the fighters and the tanks, and all have
a good selection of equipment. Fighting the enemy carrier is only a small
part of the game, most of the game is colonising or capturing islands.

It is certainly available as a budget game here; I don't know what the
situation is in other countries.

6470. How is Budgie doing? (was: Re: Copywrong and copyright)

Newsgroup: comp.sys.atari.st
Date: 1992-12-04 11:15:54 UTC
From: evilandi@vnet.ibm.com
Message-ID: <19921204.031624.607@almaden.ibm.com>
Source record: 213770

In <1992Dec3.130755.21500@lmpsbbs.comm.mot.com>, davidal@comm.mot.com (UK702 DavidAlexander) writes:

:QUESTION : How well or badly is Budgie software doing?

Not too bad, actually! Receipts of about UKP1000-1700 per quarter. This is about as good as they've ever done. Recently, there have been some problems with non-payment from PD libraries going recessionwards, but only the little ones. There are about 70 programmers with over 130 titles.

For those who don't know, Budgie is a licenceware system. They supply progs to PD libraries, and extract a royalty for each disk sold. All royalties are collated and "shared" between authors, with one title, one share.

I have three Budgie games out (Ballpark, Flipped and Square Off), and each nets me between UKP10 and UKP17 per quarter. Not excessive, but better than I'd get from shareware.

People seem quite happy to pay shareware fees for utils, but not for games (OK, there are exceptions, such as Jeff Minter who has cult status and a lot of "establishment" behind him). I have my own evidence to support this. My shareware "ST-ZINE" disk mag construction kit pays about UKP5 per fortnight, my "Quiz Construction Kit" and "Race Results" shareware utils pay about UKP5 per month. I tried issuing a shareware game, but got no response.

I don't know why this is; I offered similar "updated/expanded" version offers for all my progs.

What I do now with all my output is to flog it to a magazine cover disk first (one-off pay of between UKP100 to UKP200), and then, if it's a game, issue it as Budgie UK Licenceware, if it's a util, make it shareware. And no, the magazines don't mind, because it's stated in the contracts that you can do what you like with it, EXCEPT sell it to another mag, after three months.

Well, I think comp.sys.atari.st has had enough long appends of late, so that's all from me.

I don't think you know what I meen, if you don't have a directory called
say 'extracts', then the archiver ZOO will not generate this for you,
may be some Shells will generate a folder of the same name as the ZOO file,
but I have had big problems with redirection with shells, they don't
work...

Are not RAM Disks Drives...????

Don't forget that ZOO is a Unix port, I don't think the othere archivers are.

I've been thinking (Really). I read somewhere that for each legal copy of the average game there are about 2000 pirated copies around. Now I can imagine this is not far from the truth. Let's be honest - I used to have some illegal software myself, and only recently I decided this is what kills a software platform so I bought the stuff I used (and have the money for) and deleted the rest. Now if software companies would sell games for, say, 5$ instead of 50$, and include a little booklet with it, I guess they would actually earn MORE money since more people would buy it. 100 times 5$ plus 1900 times 0$ is still more than 1 time 50$ and 2000 times 0$, right? Let's face it; how many kids of 14 can spare 50+ $ for a new GAME, running the risk it's crap after all? I know some guys with 1000+ programs, none of which are legal except the Workbench (hint :-) and when you ask them to show some nice game, they skip 99% as being boring and worthless. Imagine having bought them all...

Look, I'm not going to defend software piracy, I just think it's completely bizar to have to pay SO much money for a copy of WordPerfect. Oh yes, while everybody is talking about GCC against commercial compilers, why don't you check out TeX against ANY commercial document typesetting system. Heh, TeX will walk over it. And ask D.E. Knuth, or any TeXer around, about his ideas on commercial software.

Unfortunately not. I read it this week on a french magazine (SVM).
Well, we will have to wait a while before seeing the "Ultimate
computer".
But if you know ATARI, you must know that when they say a date, you
will see the machine six months later in shops (e.g. STE or TT (It
wasn't a finished computer)).

The problem can be anything: MultiGEM, manufacturing ....

Anyway, the FALCON will be better than the Amiga 1200 which is called
a 'Game Machine' !!!! Poor Amiga-users.This is not going to be easy
for them !!!!

I've found that just abut every LZH file can be uncompressed with
either LHARC 2.01j (LH5 files in general) and for some "troublesome" LZH
files UNLZH172 seems to take care of those...

> However, even the UNIX version at this university (Which, being non-standard
>is only available on some machines - ZOO is available on all) CRASHES and

There is source code on some FTP sites for a LH5 compatible unix
lharc. However, I haven't been able to compile it on the unix system
I'm working on because I don't think the "C" compiler here has all
the necessary libraries...

>What is the matter with ZOO? It has been around for years, is available for
>every machine under the sun (And installed on most) and is utterly relyable.
>If you try to decompress a file which uses a new format it says that you need
>a newer version. The zoo-high compression is just as good as LHarc anyway.

True. Well, for me it's simply a matter of convenience. It took me
awhile to convert all my ARC files to LZH (and that is when I didn't
have so many). I dread to think how long converting them all to
ZOO would take (even in a ramdisk on a 16mhz system), though I COULD
always do the compressions in the background (via MiNT).

>If it were up to me I'd ban use of .LZH on archive sites.
>
>- Leo

Safest thing to do is have a copy of EACH compression utility out
there (ZOO, ZIP, ARC, ARJ, Lharc201, maybe LHA060, etc.) - that way
you can handle ANYTHING that is available. I just wish someone would
do a MAC BINHEX converter for the ST series...

I hate to waste space replying to this, but I have seen at least 3 Falcons, and two of them were 'production' units, not developer units. I'm not a developer, just an ST owner.

So what if they aren't available yet? At least they will be available - I hope Atari doesn't need to live its corporate life by constantly trying to compete with Commodore (obviously it doesn't).

Please keep your Amiga-centric messages in the Amiga-centric news groups.

I wasn't there (COMDEX) but I've heard they had a demo called 'Audio
Fun Machine' which would add effects to your voice (input into the mic) on
the fly. I also heard of a voice mail system (not sure if it used the DSP
or not, Howard Chu?) both from 3rd parties.

>the Falcon. If you buy a DSP board for the PC, you'll get *plenty* of
>software to support it. At the worst you can write your own, which is

But just imagine if there was a defacto standard DSP for the PC (ala
DSP Blaster, like the Sound Blaster is to sound). Then you could have butt-
loads of 3rd party application software support. See, you are kinda in a
closed architecture even with the PC, if you want to hear the good sounds in
your games you have to buy a SB (guess what? I heard MicroSnot has come up
with thier own sound board that is not even compatible with SB, is that true?
if so, SHEESH, TALK ABOUT GREED! They would not be satisfied selling to the
people without a sound card yet, they also want to get the people who already
have SB!). That looks like a closed architecture to me (in a sense),
MicroSnot's.

>You've also read the 40 page long Picture Formats list; the dozens of

You even helped me out personally one time. I had no idea how to do
bitmap scaling and you directed me toward 'Graphics Gems 2', thanks. But
maybe this is my point, your posts have not been very constructive lately
to say the least. (Anybody want me and Dave to take this to E-mail?) I
believe most people reading this group already have STs and read it for
information regarding the computer they already have and use. If somebody was
looking for a PC I'm sure they would not read THIS group to get info on it, at

least I could probably find somewhere else to look.

>Thirdly, dammit, I don't CARE if you don't send me money, but DON'T
>expect me to keep putting 10 hours a day into helping your community
>for absolutely nothing. Heck, I admit it -- I'm not a god, I'm no

O.K. I didn't really want to but I may as well speak my mind on this matter. I believe HacMan 2 to be a much better game than Blox (thats a compliment on HacMan by the way). HacMan was released as freeware. Blox was released as shareware. So when HacMan was being written it was not to make money, you had another reason to do so. Blox may have been written all along with the intension to release it as shareware (to make money). If this is the case I believe it shows when comparing the 2. I still have Blox on floppy but don't worry, I will swiftly format it tonight. I have an arcade style game under development right now (code is just about done, but I am in desperate need of help with the graphics, and I mean desperate. I am definatly no artist). I plan to release it as shareware with a suggested donation of $5. But in the doc file I will also say something to the effect of even if you don't want to pay for it you can keep it anyway. I would rather not make any money and still have people using my game than have nobody using the game. I think HacMan might have done better than Blox as a shareware release. Puzzle games may not be very popular?

Sorry everybody for making such a long post.

> HP Deskjet +

>Anyone know of any reasons why it takes sooooo long to save files.

I assume that you still use TOS 1.02. You can check out with your
computer by clicking on Desk/Info on the Desktop. The copyright
should be something like this:
"Copyright (c) 1986/87 by Atari Corp." (the date 1986/87 is important)

TOS 1.02 is not very suitable for harddisks, since GEMDOS of TOS 1.02
is extremely slow _and_ unreliable. Use a newer TOS-Version like
TOS 1.04 or TOS 2.06. This is the only solution for your problem.
Caches don't help much either in TOS 1.02. They do with TOS >= 1.04,
though.

with regards
Christian

>some food for his family for a change..?

Bob, giving money to programmers is *exactly* what I say is
necessary. What I'm bitching about is that neither the commercial
nor the PD way seems to get *programmers* money from users of
their stuff. Release software as PD, and users will be vultures
feeding on your work. Release it commercially, and Microsoft and
the likes will be vultures feeding on your work and on the purses
of those who want to use it. I refuse to accept that there's only
a choice between these two evils.

>Join the real world for a while, and then come back to us and tell us
>how things *should* be...

It seems that you and I happen to see some things differently.
This does in no way imply that either of us lacks knowledge about
the "real world". This world is a complex and chaotic thing, and
there are many ways of looking at it. As an example, your idea
about the importance of free information flow seems to be
different from mine -- so far, you haven't even mentioned it
once, which indicates to me that you don't think it is crucial,
like I do. I'd appreciate if you discuss such issues instead of
speculating about my income (it comes from the Max-Planck
society, which I usually don't think of as a Fairy Godmother :-)
or making suspicions about my copying morale.

>the whole world changes every 5 years.> 18 months = a double in
>computing power.

I think, though, that a lot of these advances are solutions without a problem. The difference between what you can do *without* a computer and what you can do on an ST (or even an 800) is far, far greater than the difference between an ST and, say, the upcoming DEC Alpha-based PC (supposedly called "Triumph").

When I got my telephone connected, the phone company tried to sell all all sorts of wild features--everything from call screening to three-way calling to six-hundred variants of call-forwarding, not to mention some really funky stuff. I don't give a hoot about any of this stuff. Sure, they're some neat new advances in technology, but it seems to me that somebody was really scraping the bottom of the barrel to come up with such things. Basic phone service gives you 99% of what you need a telephone for.

Yeah, and neither of these companies is doing well. Besides that, the NeXT is a Unix box, geared towards hackers, and will probably never sell well amongst the masses.

>GCC is as good (and better than some) commercial suppliers' efforts. Your
>gripe is about the debugger... this is not a part of the compiler! What you
>are describing is the user front end to the compiler and debugger... please
>think before you write!

Frankly, I'm really getting sick of people saying "please think" when they simply disagree with what I'm saying. Case in point:

>Using your analogy, the command-line version of Turbo C is a vastly inferior
>product to the user front end, even though the front end uses the same
>compiler underneath.

Yes. That's correct. If Turbo C had no other interface it would be a piece of worthless garbage in the eyes of typical programmers. It wouldn't sell well. You wouldn't ever have heard of it.

>User interfaces to compilers are trivial relative to the code generation
>side of things, it's the icing on the cake.

Ah ha ha ha ha ha! That's a good one. Why don't you tell that to the people who worked almost exclusively on user interface issues for years at Xerox PARC? Your claim is completely laughable. Compiler code generation is a well-understood *science*. User interface design is a best an arcane art, and requires voluminous amounts of code and tons of tweaking.

>Myself I would prefer a compiler
>which was not pretty to drive, but produced good code (its primary job) than
>one which looked all flash but prroduced cruddy code.

Well yourself you is not the typical programmer, which is why yourself you is happy with GCC while most of the rest of the world wants something more polished and easy-to-use. I'm perfectly happy with GCC too, but I acknowledge that I'm not the typical computer user.

>And ask D.E. Knuth, or any TeXer around, about his ideas on commercial
>software.

TeX is another great example for my argument that free software never matches up to good commercial offerings in practice. TeX is JUST like GCC in that its guts are powerful but as a whole it's completely unusable by mere mortals. You know what secretaries do when you tell them they have to put "mystery codes" in a text file and can't see what they're going to get on the screen? They throw their PC's out the window. (Not that Word Perfect is a whole lot better, but there are things like Venture that do most of what TeX can do with a WYSIWYG interface.)

Jeez, why do you think Lamport wrote LaTeX? Because TeX was utterly unusable, even for computer scientists! (Not that LaTeX is usable, but it's certainly better.)

People want to *use* their software without having to learning much. They don't want their documents to look like programs or proofs, and they don't WANT to NEED to know what -fomit-frame-pointer does.

TeX: free, powerful, overly-complex, arcane. Typical of top-of-the-line free/copylefted software.

6488. Pure (turbo) C++ for the ST/Falcon

Newsgroup: comp.sys.atari.st
Date: 1992-12-04 16:02:22 UTC
From: Craig.Graham@newcastle.ac.uk
Message-ID: <ByqsJz.DIK@newcastle.ac.uk>
Source record: 213791

Can any german netters tell me if there will be a Pure C++ released for the ST?

I'm currently using Pure Pascal for pascal developement, and would like to move to C++, but I cann't face going back to as primitive a developement enviroment such as GNU C++ (G++). I cann't easily find this out for myself as Pure C/Pure Pascal were never released here in the UK (mores the pity as nothing comes close to them for speed, facilities & ease of use.....).

If there is any possibilty of this being released, I'll put in the (fairly large) effort needed to get in touch with the makers directly.....

Thanks in advance, Craig.

Depsite the fact that I think none of my posts has been misplaced or "unconstructive," I don't think I should *have* to post constructive messages every day I'm alive to remain in this group. The main reason I haven't been able to post more technical notes here is that I've been working on a thesis and related stuff. (It's that dang real world coming into play again.)

> O.K. I didn't really want to but I may as well speak my mind on this
>matter. I believe HacMan 2 to be a much better game than Blox (thats a
>compliment on HacMan by the way). HacMan was released as freeware. Blox was
>released as shareware. So when HacMan was being written it was not to make
>money, you had another reason to do so.

Actually HacMan II wasn't shareware because I (rightly, as it turns out, though I'll spare you the gory details) feared the legal wrath of Atari for infringing on their copyright. It's hard to sue someone who didn't make any money, but easier to sue someone who made thousands of dollars.

>But in the doc file I will also say something to the effect
>of even if you don't want to pay for it you can keep it anyway.

Well then you're sure to get loads of money. Just wait and see. :)

>>seen. I almost can compair these people to the ABC/NBC/CNS nightly news.
>
>Well gee, you've certainly injected a dose of cheer and optimism into
>the discussion, haven't you?
>

Yeah Dave, I know it was a low blow compairing the people of this news group to the Nightly News ("We're all going to die and it all America's fault!!!!"). But I can't believe these messages. So Atari didn't get the damn FALCON out when they said. We've been hearing how we hate Atari ever since. It get's extremly BORRING hearing it over and over, just LEAVE so we can talk about something useful (I was talking to those people who are out for blood, Dave, not you). I even heard a number of people wishing death to the Sam and Jack: "I really wouldn't mind if the were in a car accident and died." What is up with that folks. I assume we are all college students or above here, you think that we can act with the least bit of maturity.

The bottom line here is: America, love it or leave it. Atari love it, or leave it, once and for all so we can talk about something useful for a change!

"I hate Atari, I'm going to leave....well maybe next week when after I rip on them a couple more times....well maybe next month....well maybe next year....well...." [GOOD BY!]

>Naw... :-) It's the best flight sim for PCs - or any computer, for
>that matter. :) :) :)
Well, It is a good sim, but hard to land! And I've heard that
the I*M version blows away the Amiga version hard. But that
dosen't mean the Amiga is worse than I*M!
Anyway, I was speaking of the Falcon by Atari (as you know)
Let's compare it to the Amiga. We won't compare it to the
I*M, because they are Kludges From Hell, and do not deserve
to be called computers.
A1200 Falcon
Company Reputation: Ehhhh... HAR HAR HAR!
Resolution: 1200x900 800x400
Colors: 12million A few thousand
Blitter: Awesome. Fat. Crippled pipeline.
Bus & Memory: 32 bit. 16(?!!) bit.
(This is what kills the falcon. Totally.)
Sound: 8 bit. MIDI,16 bit
(Ok, the Atari is better, but not supported)
BLAZEMONGER: Yes. No.
(Lay down and die, Atari... :)
Price: 700 700(?)
Price: 700 700(?)

There is no reason to buy an Atari, except maybe as a
hack machine. And since the case is probably HEAT-WELDED
together, like some cheap Barbie doll, you can't even
fiddle with the insides!!! I'll admit, the Atari offers
better competition than the clones, but not much!
-Amiga Advocate

> So.. anyone else out there who continues to try to feed
> themselves (or their families) from Atari programming..?
>
> Or are all the rest of us just vultures, ready to jump on the
> dead remains of those who tried to support the Atari market..?

Well, it's possible to be neither. I've just sent off my order for a NeoDesk upgrade, so I guess I'm trying to support some of the people who do feed their families from Atari programming.

I admit, though, that I've not bought any fundamentally new Atari software for ages. All my purchases in the last year and a half have been upgrades, except for the Cixread/Cixcomm off-line reader which lets me use the Cix (UK) conferencing system to greatest effect. So if Atari programmers depended only on people like me they wouldn't eat very well.

It's a vicious circle, though. Once a potential customer perceives that a platform and its programs may not be supported for much longer, s/he becomes less inclined to take risks and buy something new to use on that platform. I'd like to think that Falcon could break that circle for Atari, but sadly it looks like the Falcon launch has been messed up like so many other things.

>Mega.

You're using a CLI right? So, say your version of ZOO lives in C:\BIN

alias ZOO C:\BIN\ZOO.TTP
or
setenv PATH C:\BIN
Now, say you want to unpack MYFILE.ZOO from drive a into folder F:\TEMP

cd F:\TEMP
ZOO x A:\MYFILE.ZOO

And hey presto, the file unpacks into F:\TEMP.

Or just use ARCGSH.PRG instead of a CLI, as this supports ZOO, and makes it all point & click & easy.....

Jesus, think about what you're saying! By analogy try:

"Gee, I can't afford to buy gas for my Volkswagon Bug so I'm going to
go out and borrow money to buy a new car (which I won't be able to
put gas in either since I'll be in debt). Guess I'll just have to sneak
into gas stations and STEAL gas from all those stations who don't have
barbed wire around the islands. I know that this will be hurting all
those nice gas stations who are kind enough to let me into their
driveway, but what the hell...I have my new car!"

People like this make me sick. If this is the market that Atari
is targeting, no wonder they can't find any developers....

The other, more obvious option available to you, is to get rid of the shareware games you have not registered. You will likely not perish if you have fewer games to play, but not paying the meager shareware fees is a _sure_ way to kill off any further shareware additions. Anything else is just rationalization.

Just a question Bob. Do you have a "real job", or are you entirely dependent on Atari for a living?

The answer to that question will imply a lot about the validity of your own quoted words.

> >The reason Blox didn't bring you as much money as Llamatron did to
> >Jeff could simply be that Llamatron has become something of a cult
> >thing.

I think the "cult thing" argument doesn't really make sense, that's
really a tautology, isn't it? It's popular because it's a cult thing,
but it's a cult thing because it's popular? I think the reason(s) Minter
did well was because
1) it was uploaded to all the major online services (Compuserve,
Genie, etc) with a lot of splash at roughly the same time
and covered/reviewed in several magazines
2) Minter is well known in the games industry and to the public
through other games on several machines, and in regular
columns in magazines, over probably 10(?) years, and his
bizarreness helps make him stand out :)
3) there were very few (if any?) Robotron clones already available!

> I've tried to make those games (HacMan, Blox, Snowball Fight) as
> fun as I could. If they're actually boring and stupid, that's good
> to know.

Personally, I think the choice of Pacman as a game to clone was a
really bad idea. No matter how great Hacman is, Pacman is done to
death and nobody cares anymore. There are numerous ST versions of
varying quality, but this game is totally dead to most gamers. All
you had to do was pick, say, Archon or Mule to clone.
One possible problem with the other two is bad names. I have no idea
what Blox or Snowball Fight are, from the names, and rarely download
a game just to see what it is without knowing anything beforehand.
If they were uploaded with much fanfare to major services, and covered
in magazines so there was some public perception of what they were,
people would look at them. That is, if Blox was a Tetris variant,
just calling it Bloxtris (as a half-serious example) would give it
a better chance. Extremely few games are totally original and unlike
anything else these days.

> Well I know that some things I've written have been on the cover disks
> of some of the UK glossy magazines. I use to think it was Jeff Minter's
> feature on ST Format that got him all the press, but now that I've
> also been on there I suppose it can't have been that that made the
> difference.

I think Llamatron was popular well before it appeared on a coverdisk.
Certainly I had heard of it and tried it out well before I saw it
in a UK magazine disk. I think just reviewing it and talking about it is

more important than giving it out on the coverdisk - that makes people
aware of it. People can get the demo from several sources after that.
I only heard of HacMan recently on the net, and had no interest because
it was just another Pacman.

> The idea behind shareware is that I want to write stuff you want to
> use (or play), but I don't want to make a full-time business of it.
> Shareware seemed like a good compromise, and in the PC world perhaps it
> works well.
> ...
> ... and make some money, those people need to face the reality
> that it doesn't work that way (unless my personal experience is unique).

The shareware concept was argued to death recently on the net, and my
experience is that regardless of the platform, uploading fully functional
programs and asking "please send me money if you like it" is a bad idea.
I think it would be great if this worked, and it should work, but the
reality is that it doesn't. People are dishonest, and you won't see
any money. You'll see more money on the PC, because of the sheer numbers,
but percentage-wise I'd bet the story is the same. Unfortunate as it is,
crippleware is the only thing that works, if you can handle some
mail-order headaches.

Also the games market is getting quite saturated, and harder to please.
Couple that with bad economic times and the slow death of the ST and
Amiga, and success is pretty rare.

[description deleted]

>You will need to obtain the
>Ghostscript font archives as well. They are in Gnustuff/Tos/Ghostscript.

Not any more. The fonts on a.a were VERY old and so have been deleted.
Newer fonts are available all over the net. I think I got mine from
ftp.uu.net, but if you can't find them anywhere else, they are always
available from prep.ai.mit.edu. The newer fonts are slightly better than
the old, and also contain a couple of REAL postscript fonts, which are
far superior. Use these postscript fonts if you can (Utopia is one of
them, I can't remember the others). Also, if you have postscript fonts
from other sources, you can usually use them.

Most of the GS fonts are so ugly because they were created by drawing
piecewise linear outlines around PD bitmap fonts--YUK.

>The output of the ST version of Ghostscript to an HP DeskJet was acceptable,
>and the monochrome screen output was also good.

Personally, I think that DeskJet output (at 300dpi) is great, unless you
try to use the Ghostscript fonts. TeX fonts (placed in a postscript file
by dvips), or the Utopia mentioned above are much better. For pure
graphics, the fonts don't matter.

> The latest versions may also
>be able to direct output to a color monitor, but I haven't tested that yet.

Two and four-bit color work fine. Eight-bit color apparently works
partially, on TTs at least. I am interested in hearing peoples
experiences with 8-bit color on TTs and graphics cards.

>video hardware is soldered onto the motherboard. It's a closed video
>architecture.

A 3-5 year lifespan is an eternity in the computer field. By your standards, I would consider ANY computer architecture (including the current 486DX2/66) as "doomed"...

You can, of course, purchase a video card for your 1040ST which will give you 256 color 640x480 video mode. It won't cost $100 though -- primarily because the people who are producing the card don't forsee selling the 1-2 million boards that make such economies of scale possible. Check the comp.sys.atari.st FAQ for a list of video boards available. [True, if you don't have a Mega ST bus or VME slot, you're going to have to have the board installed by someone who is handy with a soldering iron and who can read schematics ...].

Not everyone is going to purchase one of these boards, though. Not everyone plays games ...

On the PC side, I can no longer run modern software packages on the old CGA monitor ... and, at the time of the switchover, the cost of a 'decent' VGA or SVGA board and monitor was about the equivalent of a good video card for the current crop of ST computers... So, I spent upwards of $500 for a color monitor and then had to spend upwards of ANOTHER $500 for a color monitor when the standards changed. (We're talking actual, non-1992 prices here. Sure, you can get it cheaper today, but back when the great Switchover occurred costs were higher, just like the ORIGINAL 386 motherboards cost about twice as much as a Falcon will in 1993...)

I am still using the color monitor I purchased with my 1040ST back in 1987 -- and I know that I won't have to purchase a new monitor (unless I really WANT to get one like the 17" multiscan attached to the ZEOS-486 12 feet away from my

terminal ...) when I decide to get a Falcon.

Of course, if you actually purchase a 386-33 motherboard from some of the companies listed in magazines like PC Sources or Computer Shopper (two popular magazines in the United States consisting of mostly hardware ads), you have absolutely no guarantee that the company will be in existence long enough for any "limited warranty" to run out. And, if you select the wrong company, you may suddenly find yourself with a useless motherboard ... or the need to purchase 'extras', like the CPU. Or the ROM BIOS.

6508. Copyright v. Copyleft/Open v. Closed/Dave v. Everybody

Newsgroup: comp.sys.atari.st
Date: 1992-12-04 19:10:51 UTC
From: greg@Quotron.COM
Message-ID: <greg.723496251@duke>
Source record: 213810

You know the arguments have gotten out of hand when the lurkers start posting...

COPYRIGHT vs. COPYLEFT

I'm willing to bet that just about everybody out there who strongly supports copylefting is someone who goes to -- or works for -- a university. The academic atmosphere tends to foster that sort of thing -- I know because I used to believe in it. Copylefting has all the trappings of the early days of computers, when people would just pass out paper tapes for anybody and everybody to use. It has a nice, nostalgic, fuzzy feeling. In a perfect world, copylefts are wonderful.
But this isn't a perfect world. And programmers need to eat and sleep and have shelter, none of which they can do by copylefting their work. All of which copyrights make possible -- not guarentee, mind you, but make possible.
And it's really as simple as that. I don't think the government is ready to subsidize software authorship, so coders are going to have to rely on selling their programs to make a living. Period. Love it or not, if I can't put a roof over my head writing software, I simply can't do it. And neither could anybody else.

OPEN vs. CLOSED ARCHITECTURE

I, personally, find it hard to believe that anybody would argue for a closed architecture for anything other than religious belief; i.e. my computer's closed, so closed is better. The Apple II lived years, heck -- almost a decade, longer than it should have because you could pop the back off and easily plug in new features and new capabilities. For my PC, I can choose between dozens of different graphics boards, ranging up and down the scale in ability and price.
I simply can't do this to my ST, which is why it's remained virtually unchanged since 1986, when I bought it. I can't see how the ability to take advantage of the improvements in _anything_, much less something that is as constantly changing as computer technology, can be considered a bad thing.
The best argument I've heard against an open architecture is that it fuzzes what the bottom-of-the-line is, what the minimum configuration that everything will work on, but with a little foresight and a couple of if statements a programmer can have his code run on dozens of different configurations: ST low-res and Falcon low-res, EGA and VGA, whatever...
I know, I've done it.

DAVE BAGGETT vs. THE BACK-STABBERS

And, finally, I'm totally disgusted by anybody who tells Dave Baggett that he has no business being in comp.sys.atari.st. Dave has done tremendous things for the Atari community -- HacMan II, Blox, DC Snowball Fight, the picture formats list, Game Workbench, hundreds of useful postings, TADS ST, the Unkuulian games -- and for anybody to be telling him what to do and where to go is the far side of sickening, and the best evidence yet that STers turn on their own. I think that Dave has every right to be bitter about Atari -- he's put his time, his money and his heart into the company for years, only to be left with a lot of experience and some disrespectful little twits snipping at his heels.
I registered Blox, not so much for the game (I'm not a big Tetris fan), but as a small way of thanking him for the way he's contributed to both the ST community and to my life. The picture formats list has saved me many times over, I've spend hours with HacMan, beta-testing GW led me to write some of the code I'm most proud of -- and for all of that I have Dave Baggett to thank. I suspect that everybody in c.s.a.st could say near the same thing.

>Fact: libraries make authors virutally NO money, but they cost them an
>enormous amount of "end-user" sales. Whether or not they are good for
>society, they drag down the profitability of the publishing industry
>(which is currenty in bad shape).

I'm sorry that you feel that libraries are the "enemy" of authors. I happen to support them, for many of the same reasons as I support access to networks such as the Internet, complete with services like USENET News (which brings you comp.sys.atari.st). Public dissemination of information is a good thing.

The biggest drag on the profitablility of the publishing industry today, however, is NOT libraries -- it's television and the computer gaming industry. People just aren't developing the habit of reading anymore.

I also happen to feel that without the exposure a book gets in the library, many first authors would remain single book authors. (I certainly wouldn't have paid for a hard-cover edition of anything by David Eddings if I hadn't read the first book of his Sapphire Rose trilogy at the library -- and Eddings was far from a 'single book' author.)

If profitability was their only concern, the publishing industry would only produce two types of books: Romances, and what I call "Grocery Store Novels", since these sell regardless of author. (Many publishing houses are beginning to go this route too ... check the listings to see what is coming out of Random House or Harcourt Brace Jovanovich lately...)

>3100 with more compute power than the ZEOS-486 on the desk 12 feet away.

This is an interesting point. At work (BAe Space Systems) we have the best workstations you can imagine, running at speeds that make you wince, with more processors than you know what to do with. Yet some of the most used software runs on an Apple II.

At home I've watched my PC owning friends go through computer after computer... not just pull out boards, but sell the lot and buy a new one. And these were not cheap computers. 286, 386SX, 486DX. Now, are they happy? Of course not. As the processor speeds went up, the quality of the code went down. The things they could do with it on a fast machine increased admitedly, but just the simple things introduced incomprehensible overheads.

The net result is that a drawing package on a 486DX with a 'real-fast' graphics card will look much nicer than one on an Atari. And do more. But will cripple the full potential of the processor, which should do so much more....
Inefficient software will always (for the forsee-able future) make the owners of the latest in hardware feel like they're miles ahead of the field, travelling at warp 10, but really not getting all that far.

I feel myself waffling, but the point I'm trying to make is that there is a place for all speeds and architectures.

By the way, has anyone but me noticed what a mess sparc-stations look when you get a decent collection of expander gizmos together??????

>There might be a few folks here who were on the verge of actually
>upgrading their systems with products for sale in that nasty
>Computer Shopper.. you know.. the ones with motherboards, drives.
>memory, I/O.. silly little things like that, for sale NOW...

Of course, I can't upgrade my Mega 4 with a 486-33 motherboard found in the Computer Shopper. And I don't currently own an Intel-clone machine, although I have access to 286 and 486 machines through my job. So all of those silly things on sale NOW don't do a thing to me.

Or are you inferring that I CAN upgrade my Mega 4 with an Intel motherboard?!? That would be exciting -- please post details!

I don't plan on purchasing a Falcon until well after my house is built anyway -- things like closing costs and appliance purchases take priority. That doesn't mean that, once the Falcon is on sale at the local dealer (and, yes, Minneapolis DOES have a local dealer) I won't be coming in towards March or April with the intent of purchasing one.

>I guess the question is, do you want to "keep the faith"..
>and go learn to do something else with your time, like maybe
>take up mountain climbing, or macrame, or watching water
>evaporate... or maybe you'd actually like to use your
>computer for (dare I say it..?) computing..?

I can use my Mega 4 right now thank-you-very-much. I don't have any "faith" to keep, Bob, since I already have access to more hardware platforms than you're likely to purchase during the rest of your life.

Besides, I prefer scuba diving to mountain climbing. Unfortunately, there aren't any oceans or mountains worth investigating in the Twin Cities area, so I'll just have to do something else with my time, like answering stupid postings such as yours.

>Those "dark ages" computers (brothers to the original 1985 ST)
>can be take far beyond their original incarnations, easily,
>painlessly... unlike their Atari brothers..

This is certainly news to me. What boards can I purchase for my Apple //e which will bring it out of its 1984 mind-stream? Note that my system (well, actually, it's at a friend's house and he lives in San Diego...) had a multisync monitor, an internal modem, 128K of memory, and the 3.5" floppy drive. I bought an ST in 1986 -- the year Apple brought out the //gs -- for which an "upgrade" path is unavailable.

The XT I used to own can now be taken far beyond its original incarnation -- but at the time the 286 came out it was cheaper to purchase a new computer, and the same thing applied when the 386 came out (and the 486 ...)

You see, only a fraction of PC owners are going to rip out their old motherboards and replace them with new motherboards. The real consumers relegate their old hardware platforms to the closet and purchase a new hardware platform.

BONK

You missed my sarcasm entirely.....

I didn't "upgrade" (*spit*)-- I still have my fingers.

[OB boring part of post.....]

I actually used a TRS-80 to learn to program. I was fascinated with
things such as:

```
10 FOR X = 1 TO 100000
20 PRINT X
30 NEXT X
```

I'd then pot a semi-colon after the X and gete a neat new result. I
tried a comma, WOW, it was FUN! I'd let these programs run all day!

Then, one day, I went to a science fair and saw white lines on the
screen-- from then on I was hooked on graphics. I forgot what I paid
for my atari 400 with 16k, but it was nearly my life savings :-).
Hey, that basic cartridge was EXPENSIVE! At that time, I bought the
atari because it was the only one I could afford and that I had access
to (via a dealer). Some of my friends had C64's, but I didn't like
their "look and feel". The first thing I'd do when I sat down in
front of a computer was write a loop to poke to memory and find out
where screen mem was (yeah, I had experienced a LOT of screwy
things!). Once I found where screen memory was, I could normally
write a program for ANY computer I used (damn apple video memory!).

>We are foolish if we feel we have to have the latest and greatest for
>its own sake, but we are more foolish if we refuse to use new
>technology out of stubbornness, or refuse to buy computers into which
>new technology can be easily intergrated and instead choose ones that
>we must throw away when we tire of waiting so long for them to finish
>their tasks.

I'll sell my 1040st and buy a falcon030. If the 040 comes out, I'll sell my 030 and get that. I'd do it if atari was going to fold the next day. I don't have to program on the atari to feed myself-- I program for fun. The atari falcon will be a fun computer.

I think your argument is for the "new and the best" -- I don't need that. I don't think everyone needs it either. Sun is now claiming "rightsizing" ... interesting. I want something that is easy and or fun. Who cares if the machine is 1MHz, 4MHz, 8MHz, 12MHz 16MHz, 20MHz, 25MHz, 33MHz, 40MHz, 50MHz, or if I can swap between any of those if my karma and the phase of the moon is right. If I wanted the newest or the best, I'd attempt to justify it and then I'd get get my employer to buy it. I use my ST as a fancy terminal with UW to access Sparcs, SGI, etc-- I don't compare the falcon to a SGI380VGXT system and wine when my atari doesn't quit come close.

If you like want or feel you can't survive without an Intel inside, GO FOR IT. If Atari feels (or doesn't have a clue if) it can survive with a 030 in the '90s-- let them try and let them find out. If you don't want to watch, don't look-- it's your choice. If they fold, will you change religions? What I am saying is, perhaps Atari once made new and innovative machines-- well, times change, so what? If you don't think they are at the cutting edge of technology, don't buy their machine. Every year many new products are introduced and they go away. TV shows are introduced that don't make it half a season.

I laugh when I think of a 030 in the '90s. 16 OR 32 bit bus.
However, if it could be a FUN machine, I'll give it a look.

Personally, I'd like to see a machine where you had 1024 or so 6502 compatibles inside... It'd be a FUN machine.

Scott

Hi everyone,

I don't understand all this fuss about closed/open architechture... All this was a direct result of the failure of IBM to copyright their machine. The following may be a little simplistic but IMHO, its always the case that once a user has a computing platform, its only natural to want more "power". This has largely propelled the compatible market in sales (the more sources of computers at lower prices, the more sales hence the more support). In the case of IBM, the fact that 486's are so cheap and abu

ndant make it the most popular platform for users.
My point through all this, is that the whole argument about open/closed architechture will be MOOT following IBM's release of their "586" (it won't be called this though). I'm sure most of you know that IBM is definitely going to copyright this release so compatible makers can never get their hands on it (except over the threat of a very large lawsuit). Once the 486 has faded as a "standard" in the computing field, IBM will take over the reigns of its lines, therefore stopping all the ripping-off of i

ts machines.
Now, I'm not sure that IBM wants to have an open architechtural system for the sale of the (as yet unreleased) "586", but if it does, then the question of open architechture vs. closed will resurface, but 'till then IBM compatible users are at a dead end. Not to be a killjoy, but the simple fact is that IBM users are not going to get away with rock-bottom prices for that much longer.

Thanks for listening.

p.s. This is my first posting in this group, so if anything screws up, please forgive.
p.p.s. To make this relevant, I am not Unbiased - I support ATARI, and I'm impatioently waiting for the Falcon also ...
p.p.p.s. *Please* if you have a disagreement or personal view, try a rational argument...foaming at the mouth does not help...

6515. GEM Shell for .lzh .zoo .arc?

Newsgroup: comp.sys.atari.st
Date: 1992-12-04 20:02:44 UTC
From: leonp@cs.kun.nl
Message-ID: <Byr3oK.Dx4@sci.kun.nl>

I'm looking for a nice and complete gem shell (or three different shells)
for these archived files.
I already looked at some, but what I want is more or less what stzip offers
It allows you to view files from an archive in a gem window and
to select which files to extract.

Is there such a shell for other archive formats and where can I find it?

6519. PFX-Packer/AFX/DC-Squish

Newsgroup: comp.sys.atari.st
Date: 1992-12-04 20:43:59 UTC
From: wells_s@kosmos.wcc.govt.nz
Message-ID: <1fofuflNNgka@golem.wcc.govt.nz>
Source record: 213811

DC-Squish will pack all .PRG and .ACC files, leaving them still executable!

AFX will not *pack* anything, but the option for it in Lharc v2.??? and
above will pack non-executable (e.g. not .ttp .prg .app .gtp .acc .tos)
files for AFX to do 'on the fly' decompression of.

PFX-Pack will pack *anything*. Packing data files with it will make them
compatible with AFX. Packing executables or accessories will make them
well, packed, whilst still running as previously.

The only time PFX-Pack should not be used to pack an ACCessory, is when that
accessory writes data to itself. As it will either crash, or destroy
the compressed data, trashing the file.

I have over 800k of ACC's, put onto a 720k disk. There is still over 200k
remaining. (e.g. approx 520k of the disk is used). I didn't pack them
with DC-Squish, and they all still work fine. It has been said by people
(well, ONE person) that this is impossible. If so, why am I currently
running with 2 ACCessories (which I have packed with PFX-Pack) installed!?
(The accessories in question are the Contol Panel, and 'Mystic' which is
a background disk formatter.) I have had NO problems!

I uploaded an accessory (de-uuencoded filesize 2112 bytes). in uuencoded
format to this message section. This PROVED that it worked, as this
accessory worked 100%, and had been packed with PFX-Pack.

Other people have also said they have done similarly (SOmeone had
Butler James packed with PFX-Pack, WORKING).

How many other people have managed to pack their 'impossible' ACCessories
with PFX-Pack. (Version 1.8 or 2.1 are the only versions I can think of,
I use v2.1E (english version).)

If you use ACC's, and they aren't packed, try it - it saves loading time
(if you are running from Floppy) and it saves disk space, and the depacking
time is almost un-noticable!).

Having a Hard-Drive has nothing to do with it, it works perfectly from
HD, Floppy, or RAM-Disk!!

If someone doesn't try this, and still insists it doesn't work - something
is very wrong!!!

>free/copylefted software.

I'm not going to argue with you about the general usability of TeX, but I'd like to point out a few things. Back at my engineering college, all of the secretaries used troff. They wrote their own troff macros, did all their documents in troff, etc. Certainly nobody told them they had to embed "mystery codes" in their files, someone told them what a macro was and they just plugged right along.

I would surmise that this was not an altogether unusual pool of secretaries, since the Unix system itself had text processing as its first major application, way back in the misty days in Bell Labs. That was *all* it was used for, timesharing a bunch of doc writers who were all using roff. Since this was the major use for the system, and its popularity still spread like wildfire, I would guess that quite a few secretaries in the world were perfectly happy to compose and use troff macros for their document processing.

Finally, troff is far less comprehensible than TeX. (To me, anyway, although I have admittedly only used roff to write man pages...) I think you're being a bit over-critical of the package and underestimating the users...

Anyway, moving on to some other nagging points (I bet you mentioned those words *just* to get this exact kind of response, too... }-) - TeX is a typesetting system, first and foremost. It may seem "arcane" to you, but the terminology used is the very same used by all those poor folks who had to do typesetting

by moving a bunch of lead blocks around on tracks in a big printing press. Sure, it's not common lingo, but it was based on an established jargon, one that an established class of professionals already used or had been using for literally hundreds of years.

Of course, I personally agree that TeX itself is difficult for me to use, and I also use LaTeX instead. (Of *course* TeX is unusable by computer scientists, most of them don't know diddly about typesetting!) I don't think this practice invites any criticism of TeX, tho, it just points out the ignorance of most computer-science types (myself included, tho I was a C.E., not C.S. major).

As for people wanting to use their software without learning much - I don't accept that one at all. Take a look at the current dungeon/adventure style games, or the jet/helicopter flight simulators - there's usually a pretty thick manual accompanying those games. For simulators, people want as much realism as possible, and those manuals are packed with all kinds of info on aeronautics and flying technique, and you need to absorb it all in order to play the game successfully. And people *do* plow through it all, gladly.

Coming from the other direction, if you want a simple tool for a simple job, fine. But don't expect to pick up a powerful tool like TeX and not have to learn a few things about typesetting in the process. If you don't wanna know those things then you picked the wrong tool for your job. I've seen the way documentation groups have embraced this stuff because it was the Latest and Greatest Wave of technology, even though it did 9 zillion times more things than they needed. When they later bitch and moan about how tough it is to use, once again, it's not the application's fault, it's their fault for just trying to pick up something trendy to do something they could easily have done with a plain-jane text editor.

As for people who want to use compilers without knowing what the optimization switches do - that's just plain idiocy. If you write code and don't care about optimizations then don't use any of the optimization switches, that's simple enough. (Although I'd say that's still idiotic...) There's no way you can write software for a platform without being aware of the idiosyncracies of that platform. (Ever look at C programs on a PC? Ever wonder what all those "near" and "far" keywords were doing scattered all over the place? And what is this phrase "memory model" all about, anyway?) If you think you can write software for any machine in total ignorance of the underlying architecture then you're in for a rude awakening. (That's a general "you" there, I know you (Dave) already know this stuff...)

>exists...

Seems to mee that YOU need/want the Falcon 040!
Then be prepeard to pay for it!

Don't forget that the F030 is a upgradpath for ST owners, not for TT owners.
Don't forget that the F030 is aimed at a new, yet unestablished marked(1)!
Don't forget that the F030 is the new entry level machine from Atari(2)!

(1) Atari hopes to make up a whole new marked with the Falcon concept, because
even if YOU havent realized it; its not only a new computer, it's a new
CONCEPT!

(2) This is why it has to be as inexpensive as possible. Even if that means
they have to cut a few (unimportant) corners. And nobody realy knows until
they have tried the machin, if they'll miss those corners!

6526. Closed architecture harmful? Maybe.. maybe not

Newsgroup: comp.sys.atari.st
Date: 1992-12-04 21:24:07 UTC
From: smiller@bnr.ca
Message-ID: <1992Dec4.212407.22819@bnr.ca>
Source record: 213812

I would agree with previous posters that most PC/MAC buyers make their major upgrades by buying new machines. This is what I have seen, anyway. Especially since the recent PC price plunge, most systems come with SVGA and large HD's. I would expect the majority of upgrades are for SoundBlaster cards and the like. Buyers these days buy boxes. They don't need or want, for the most part, to worry about the details of what's inside. They want to run Windows or WP5.1, and play a few games. This assumes that the large majority of PC-buyers are not technically oriented. This would NOT apply to most USENET readers, but to the 'real world'.

With this in mind, closed architectures like the ST are not a problem. The problem has been, with the ST line, that there has been no adequate 'new machine' upgrade path either!

(Another Atari History Lesson:
For too damn long, ST's were 8Mhz 68000s. While this may
have been sufficient for most users, there are always people who want more.
Atari broke new ground in 1985 with the ST. It was cheap, it was fast, it had great graphics. It used the then-uncommon 3.5" disks, which became the industry standard. However, the industry moved. CGA/EGA gave way to VGA, 80286s to 386s, 360k to 720k to 1.4M disks, etc. Atari changed the ST slowly, when it finally did. An industry-leader became an industry backwater.)

Now, there is, (theoretically, anyway) the Falcon030. Here is, finally, another groundbreaking machine from Atari. Built in DSP, (All the magazines have been crowing about how DSP is the wave of the future in PCs),
2.5" internal hard drives (The fastest up-and-coming HD format - it should meet 3.5"HD cost/megabyte next year, and has several form-factor advantages).

And finally, at least VGA graphics, 1.4M floppy, real SCSI, and it's pretty cheap.

Now, the big advantage of (semi) closed architectures: the minimum configuration is not that minimal, and ALL software can depend on the DSP, on at least a 1M of memory, on the sound system, on a minimum level of graphic ability, etc.

There is one thing I think Atari should do: populate the 881/882 socket! For a 16Mhz 881/882, it couldn't cost very much, and once again, the software could depend on it always being there. (I've seen 16mhz 881s in Mac magazines for 35 or 40 dollars, 882s a little more. In 1000's, it must cost less.)

A 16Mhz 030/882 is probably a match for a 33Mhz 386 (sans 387) in most applications, and would really shine in the most punishing applications (like, 3D animation and games) PC software can't count on having a 387.

Advantage: Falcon030.

When the mythical Falcon 040 appears, the software will already be making use of floating-point whenever it could. (The 040 has this built-in, except for transcendentals) The speedup of the 040 would be even more pronounced.

Imagine, 68030, 68882, 56001. Massive fixed and floating point power! This would mean Atari, once again, would redefine the term 'entry level'.

But I don't recall anyone at Atari soliciting opinions from me.

Agreed, but reducing the profitability of producing the information
leads to a sitatuon where no more information is produced. At least in
a capitalist society.

>I also happen to feel that without the exposure a book gets in the library,
>many first authors would remain single book authors.

True. What you say here has merit. I suppose you could extend this
to conclude that piracy helps the software industry because it gives
things more exposure. Maybe, but I wonder how far it goes.

>If profitability was their only concern, the publishing industry would only
>produce two types of books...

Look, it's not black and white. You're seeing it as though publishers
are either chairty organizations or completely money-grubbing. In
reality most are neither, but publishing most kinds of books is really
a struggle (consider, for example, that only two countries in the world
do glossy color printing any more, and both are expensive -- Japan and
Italy). My only claim is that libraries reduce the money made on
books. And that equivalent institutions for software would hurt the
software business even more than libraries hurt the publishing
business, because once you have a copy of a piece of software there's
no tangible advantage to getting a legitimate version.

Note that I never said I thought libraries were a bad idea. Just that
software libraries, if operated the same way book libraries are
operated, would be a bad idea.

You need to use the control panel (Atari's or something else) to turn on keyclicks. Then save the Uniterm configuration. This also works for your color settings.

From: sjkinneb@mtu.edu
Message-ID: <1992Dec4.220957.16885@mtu.edu>
Source record: 213817

I just ftp'd Simon Gornall's Mint Distribution Kit from a.a.u.e and when I try to run the SETUP.PRG, I get two bombs. I have a 4meg 1040ST, TOS 1.0, the original ICD host adapter and v. 5.5.0 of the ICD driver. I've tried the program with my normal setup of auto programs and accessories and without any of them. My hard drive is partitioned into regular GEM partitions, no BGM. Is it possible that the setup program in the zoo file is corrupt or someting.

Any help would be greatly appreciated.

6530. What I would do if I was running Atari...

Newsgroup: comp.sys.atari.st
Date: 1992-12-04 22:20:23 UTC
From: smiller@bnr.ca
Message-ID: <1992Dec4.222023.23813@bnr.ca>
Source record: 213819

My previous post, about making a math coprocessor standard on the Falcon, got me thinking: What would I do?

1) Populate the math coprocessor socket from the very beginning.

2) Bundle in a capable and bug-free 'Atari-works' package. This will give people something reasonable, but shouldn't inhibit big-name software houses from porting their stuff.

2) Make sure the Falcon040 isn't TOO far behind, with at least the capabilities of the TT/030. (1280x960 graphics, VME slot) In the new case, of course. You don't want to stifle Falcon030 sales, but you want people to get a warm feeling that you plan to be around for a while. Introduce it early, but price it initially such that it doesn't hurt the 030. (Remember the C64 and the VIC, Jack?) Evolve the machine. Look at what's going to be the price/performance leader NEXT year, not LAST year.

3) Maybe, later, introduce a Falcon/030 II, with 33mhz 030 and 882, in a new case, if it is cost effective compared to the 040. (It might be cheaper to slap in a slow 68040 instead of speeding up the bus to 33Mhz)

4) Make damn sure there is AT LEAST SOME big name software for the Falcon/030 early in it's life. A little productivity (WordPerfect 5.1), a few games (Falcon 3.0, Chuck Yeager, Stunt Island) would help. If the companies are reluctant (because of past Atari failures) - DO THE PORT FOR THEM. Lend them Falcon030 experts for a while. Do what it takes to get a few big titles on the shelves.

5) For the software developers who have been supporting the Atari all along, (Like Spectrum Holobyte, with Falcon and Flight of the Intruder) - don't SELL them development machines - GIVE THEM A FEW!! Each program that they come up with will sell hundreds of machines. A BIG return on a few free computers. As above, support them with FREE EXPERTISE.

6) Offer independant developers (Like the Dave Baggetts of the world) great deals on hardware, software, etc, if they come up with a few programs that are worth distributing through the revived...

7) Atari Program Exchange (APX), via which all dealers have access to a broad range of *very inexpensive* software (cheap enough that nobody would bother to pirate it, and cheap enough that dealers can throw it in for free to sweeten a deal) A not-quite-free alternative to shareware, and the small-time developers would get a few bucks, as opposed to none. But keep the quality high.

8) Sell packages in North America like those I see advertised in the UK. For example, a 'games package' with the F030, joysticks, and a handful of

first-rate commercial software. In large quantities, you should be able to do this pretty cheap, since the developers know that every copy bundled is one less copy to be pirated.

9) Market the machines with 'Not just another boring PC clone', and 'you don't have to rip it open to give it decent sound and graphics'. Remember, Atari's home is the MASS MARKET. Get a 1-800 number so Mom and Pop can call for (where do I plug in the mouse?) support.

Ah, there I go dreaming again.

Oops, another one:

10) Buy a Falcon030, get a Lynx for free! You make the money selling the software with those, remember.

(P.S. to Atari: Give me a call if you want me to run your North American marketing. :-) I'll even quit my day job. It'd be fun!)

I'd LOVE to see followups on this.

Howdy. Say, did you know that Unix systems only buffer up to 256 characters per input line? You really oughta hit that carriage-return a bit more often...

> My point through all this, is that the whole argument about open/closed architechture will be MOOT following IBM's release of their "586" (it won't be called this though). I'm sure most of you know that IBM is definitely going to copyright this release so compatible makers can never get their hands on it (except over the threat of a very large lawsuit). Once the 486 has faded as a "standard" in the computing field, IBM will take over the reigns of its lines, therefore stopping all the ripping-of
>
>ts machines.

The 586 was designed and is manufactured by Intel, not IBM. At any rate, IBM hasn't been the leading force in the PC-market for quite a long time now; what they do is irrelevant to the great majority of PC users. Trademarking the name "Pentium" isn't going to mean much of anything, as long as Intel continues to sell to anyone willing to buy; clones will continue to be made and sold.

Remote MicroEMACS..

Well I am finding that not all COMMS programs are the same, so far I have tried
3 to find out how to send a SET MARK..

Stalker 3 could not do it so far, looks the most incompatible,
Flash 1.6 will send the ^W but not the SET MARK so far, but Uniterm
set for VT220 so far had many Keys that woulds send a SET MARK...

^2 , ^Clr.Home and some of the arrow keys...

Is the SET MARK a NULL..???

Is there a ACC/TSR that I can monitor what is going out in Hex,
I have worked with Terminals that could do that...

Roger..... sheppard_r@kosmos.wcc.govt.nz

> we haven't decided yet.

Double-Click's loss will be deeply felt - their "utility-of-the-week"
program produced a TON of useful hacks to transmogrify my system with,
I still use DC-Format (tho' only to write DOS boot sectors, I use NeoDesk
for the formatting usually), and I was on the verge of getting Data Diet.
Since Data Diet is now part of Trace Tech, I'll wait for them to release
it, and I won't have lost anything there.

The main problem to me now that all of the DC-ware is PD, is that I'll
feel eternally guilty for using any of it without paying money...

As for Game Workbench, I'd absolutely like to see it come out. Despite
the fact that it's a year overdue, it's still better than the
alternatives (ie - hand-hacking bitblt images and sounds)... But if you
don't publish it, you'll never get anything for it...

With the F030 coming out, it's more essential than ever that there be a
good graphics/game/sound toolkit, so it's easy to make new software that
works on it.

If you have to, publish it yourself by direct mail. Even if the
initial packaging isn't beautiful, it'll sell, and the ST magazines and
networks do reach most of the ST programmers and programmers-to-be. When
you see how well it's selling, you can decide if you want to get
professional-quality packaging. As long as the manuals don't look like
they were run off on a photocopier, I doubt anyone will complain about th
lack of pretty boxes in any case...

>This is what I have seen, anyway. Especially since the recent PC
>price plunge, most systems come with SVGA and large HD's.
>I would expect the majority of upgrades are for SoundBlaster cards and
>the like.

Sound blaster cards aren't insignificant, IMHO, they're better than anything you can put in an ST (i.e., a digitizer in the cart port) and you *CAN* put one in a vintage 1985 PC.

Here are some examples of things you can add easily to a (relatively) open architecture like the PC that you can't easily add to a closed architecture like an ST:

Item 286-PC 520ST
---- ------ -----

Ethernet $109 card I laugh in your face
24 bit video < $1000 card Not
Graphics accelarator software, $100-$1500 card Software only
Co-processor card DSP, TI34020, AMD2900, etc. Get real
Extended sound Soundblaster, Pro Audio 16-bit 8-bit cart port hack
D/A, A/D boards
Disk compression Stacker card (fast enough so Data Diet (you notice)
you don't even notice)
MIDI Cheap cards In there already (whew)
Modem Internal or external External only

As far as "minimum assumed configurations" go, good, inexpensive cards quickly get integrated into the mainstream and become part of the moving LCD. Are there any PC games made anymore that don't support the Adlib standard? Or VGA? Most shareware does these days.

Sure, it's a pain for developers to have to support many different add-ons, but it's a better situation than not having options at all.

If you look at the list above and say, "But the Falcon will have this, that, the other," you're falling into the same trap that people did in 1985 when they thought they'd never want to add anything to their ST's (like stuff from the list above). You can give a 1985 PC all the capabilities of a Falcon by putting in cards. Assuming you already owned a functional 286 system, you could probably do it for less than the cost of a Falcon. *And you could continue from there*. Can you do the same for an ST? No way, because it's a closed architecture.

Atari's decision to support such standards as SCSI (-2?) and VME are steps in the right direction. I don't see why those of you who are in

favor of closed architectures aren't MAD that they've *openened up* these parts of the system. But just peripheral expansion capability isn't enough. I still stand by my claim that when ISDN becomes ubiquitous you'll be able to put an ISDN card on your 1985 PC. It might not be as fast as it could be in a 1995 PC, but it'll still work just fine.

You won't be able to do the same with an ST or a Falcon. And that's just dumb on Atari's part.

An open architecture costs nominally more (if that) and encourages third party add-ons that make a machine more useful. It extends the useful lifetime of the machine. It makes good techinical sense and is smart business.

>Advantage: Falcon030.

For 6 months? A year? In the end, Atari loses again. Much as I am a die-hard Motorola sympathizer, I just can't get excited about the Falcon. It's basically just an ST made to 1991 pop specs. Which puts it in the same boat as the ST in 5 years (probably much sooner given Atari's continuing power dive into the red).

>But I don't recall anyone at Atari soliciting opinions from me.

I don't recall Atari soliciting opinions from anyone! (They certainly did want to hear mine when I was in Sunnyvale!) When I pointed out that 1M wasn't nearly enough RAM to put in the base model (because you won't even be able to page flip in the 640x480x16 mode), I got only blank stares. (That screen mode requires 600K per screen.)

Finally, since some people are question the veracity of my PC motherboard price claims, here's some prices from a random page of PC Sources. (I.e., you could do better):

System Cost

486DX2-66 $1168
486DX-50 $836
486DX2-50 $750
486DX-33 $630
486SX-25 $380
386DX-40 $335
386DX-25 $309
386SX-33 $283

Above prices include motherboard and CPU, 1M RAM, 1.44M floppy drive and controller, mini-tower case, standard ports (2 serial, 1 parallel, 1 game), 200W power supply, keyboard.

Add $250 to the above for SVGA and a monitor. Add $60 for an Adlib compatible card, $180 for a Soundblaster Pro with D/A.

(Source is p. 136, PC Sources, November 1992.)

For motherboards alone, with CPU:

Board Cost

486DX-50 $678
486DX2-50 $598
486DX-33 $448
486SX-25 $212
386DX-40 $186
386DX-25 $146
386SX-33 $128
386SX-25 $108

(Source is p. 546, PC Sources, November 1992.)

For Falcon-equivalent CPU power, we'll call it a 386DX-40 to be *very generous*. BobR was right on the mark when he said $185. Wouldn't it be great if you could pop out the ol' ST motherboard and shove in Falcon-level power for $185? Would anyone be running at 8Mhz anymore?

Yup. I wanted to whack them on the head with a big stick when they
told me they were targeting the machine at game companies but had no
plans to package a game development system with it. (You can probably
imagine where this might have led, but I'm really just giving this as
an example.)

The point is, you gotta have software. You gotta bundle some nice
software. GCC and TeX don't cut it with normal people; they want nice
mouse-driven easy-to-use, maybe not-so-powerful stuff. They don't have
to create ad copy, they just want to write a letter to mom.

>2) Make sure the Falcon040 isn't TOO far behind, with at least the capabilities
> of the TT/030. (1280x960 graphics, VME slot)

Better yet, make it an open system. (But I digress. Enough.)

>3) Maybe, later, introduce a Falcon/030 II, with 33mhz 030 and 882, in a new
> case, if it is cost effective compared to the 040. (It might be cheaper

Sell motherboards to allow cheap upgrades. Encourage cloning rather
than stifling it.

>4) Make damn sure there is AT LEAST SOME big name software for the Falcon/030
> early in it's life. A little productivity (WordPerfect 5.1), a few games

> reluctant (because of past Atari failures) - DO THE PORT FOR THEM. Lend
> them Falcon030 experts for a while. Do what it takes to get a few big
> titles on the shelves.

This is *amazingly* important. Commodore got a step ahead of Atari
from the beginning by PAYING some developers to write stuff for their
machine. I mean word has it that they GAVE them machines, PAID the
programmers' salaries, and then let the companies resell the stuff.

Sweet! That's the kind of offer even the big names won't ignore.
(They may refuse it, but they won't ignore it.)

For a multi-million dollar company, paying a few programmers to write
stuff ahead of time is a drop in the bucket. Atari did a litle of
this; they gave Jeff Minter a Falcon over the summer (first one
exported, by the way), and they gave Neil one so we could consider a
Falcon Game Workbench (after they semi-psyhcotically insulted me for
about three solid hours, but anyway).

But that's nowhere near enough. Little players like JM and us don't
sell machines -- Word Perfect Corp, MicroSloth, and Borland do. Give
'em a machine. For God's sake, give 'em a roomful. It can't hurt.

>6) Offer independant developers (Like the Dave Baggetts of the world) great
> deals on hardware, software, etc, if they come up with a few programs that
> are worth distributing through the revived...

Brilliant! Excellent! I'm all for it! :) This could go along with...

>7) Atari Program Exchange (APX)

Ah, APX. A brilliant invention. It was great. Bravo that idea.
Bring it back. It would have solved all my "problems" with shareware!

>9) Get a 1-800 number so Mom and Pop can call for (where do I plug in
>the mouse?) support.

"Give that fan a contract." (Overheard at Camden Yards, home of the
Orioles. But I digress again.) Why isn't THIS MAN running Atari?
He would clearly do better than Jack & Sons.

If you're going to target a machine to computer-idiots (sorry),
you have to give them a way to ask for help. Seems obvious to me.

>(P.S. to Atari: Give me a call if you want me to run your North American
> marketing. :-) I'll even quit my day job. It'd be fun!)

I'd give you Sam's job if I could...

I would say that this only demonstrates that a 1988-era PC is better than
a 1985 era ST. That doesn't prove anything about an open system vs a closed
system, really. There are few items on your list that are impractical due to
the ST architecture, they are merely unavailable because no one invested the
time or money into developing them. Ethernet, extended sound, and disk
compression could easily be accomplished by a device hanging off the ACSI port.
Internal modems are a waste of money, and not even worth mentioning.

Also please note that I am not particularly in favor of a closed system design,
I would have loved to see a machine with all the built-ins of the ST and also
a multi-slot expansion bus. But once again, that just invites a whole host of
compatibility problems. I don't know of very many 24 bit video cards for PCs,
and certainly no software standard for driving them. It took 4 years before
there was a good software standard for interfacing to ethernet controllers,
and even then (packet drivers) you'll find things that can't be done from
driver to driver...

I suppose. But having software that doesn't work with my given configuration
is about the same as having no software at all. Doesn't seem a whole lot
better to me.

That's being overly naive. There are already several SCSI-based ISDN products,
so this assertion is just plain wrong. ISDN is not some magical high-speed
network, you don't need "localbus" to support it; in fact it's a pretty slow
technology as networks go.

They were probably staring blankly trying to comprehend your arithmetic.
640x480x16 only requires 153KB per screen. (Or more precisely, 1.5K * 100).

Bzzzt, wrong!

You can get co-processor boards for ANY ST!

You can get Hard-ware screen accellerators for the ST!

You can get 24-bit graphics boards (Although, I'm not sure if they work
on the 16-bit ST's)

The STE has 50Khz sound playback BUILT IN, a soundblaster is required
on the PC for this. (Or a roland sound card, or adlib etc. etc.).
Although, it slows the processor to almost 0% it is there to start with!

IBM compat's are nice machines (barring the awful user interface), but
comparisions between it, and the ST, are pretty pointless. Why upgrade
unless you need to? The only thing I've ever even wanted to upgrade
in my STFM was the memory! (512k just is not enough!)

From: wells_s@kosmos.wcc.govt.nz
Message-ID: <1fp5brlNNihr@golem.wcc.govt.nz>
Source record: 213840

What resolutions will the Falcon 030 supposedly display on a standard atari colour monitor (e.g. SC1224)

I know it does ST-Low & Medium, and interlaces ST-High (or some such thing). But will it do the VGA modes, or indeed, anything other than the 3 standard ST Modes??

Also, if the DSP is going to be used as a modem, where do you plug the phone line into the computer? I don't recall mention of a socket 8-)

- If you don't own an Atari, whaddya doin' in this group?!?!

Well, when I use Uniterm and hook up to our mainframe and run emacs I
use CTRL-SPACE for set mark, and that works okay for me. It should be the
same key-combo for microemacs.

Hello, McFly, anybody home?

640x480 = 307,200 pixels
16 bitplanes -> 2 bytes per pixel -> 307,200 * 2 = 614,400 bytes.

This is the incorrectly-called "true color" mode. That's the mode they wanted games written for.

>You can get Hard-ware screen accellerators for the ST!
>You can get 24-bit graphics boards (Although, I'm not sure if they work
>on the 16-bit ST's)

Care to elaborate here? I wasn't talking about replacing the whole
motherboard, you know!

You tell me WHO I call and WHAT I do to put any of the three things you
mentioned into my ST without hacking the thing to pieces.

>The STE has 50Khz sound playback BUILT IN, a soundblaster is required
>on the PC for this. (Or a roland sound card, or adlib etc. etc.).

A) I wasn't talking about an STe; I was comparing equivalent circa 1985
machines. Can't add DMA sound to a 1985 ST, now can you? Gotta
"upgrade" by tossing your ST out the window and buying a whole new
STe. See my point? If your ST weren't closed up like a drum you
could add your DMA sound thingy for about ten bucks, and could then
experience the mind-numbingly awesome stereo panning effects in
Blox Plus! 1/2 :)

B) Though it's largely irrelevant to the argument to the argument at
hand, the STe DMA sound is brain-damaged. Whoever thought having
four nonstandard, fixed sample rates (6.25, 12.5, 25, 50) would be
better because it would cost a dollar less per machine should be
taken out and shot.

>IBM compat's are nice machines (barring the awful user interface), but
>comparisions between it, and the ST, are pretty pointless.

You fail to explain WHY comparing machines is pointless. In this
particular case, comparing equivalent 1985 machines shows why closed
architectures are a pain in the butt. (Consider your own DMA sound
example.)

That's why I compared machines, because it facilitated my argument.
Seems pointful to me!

I'm sure you will get flooded with responses to this, but the most
interesting new mode by far is the 640x480x16 (Dammit, Jim, 16 BITS, not
16 COLORS!) which is actually superior to any standard VGA or SVGA mode.
(Hmmm, I'm not sure what the new "VGA HiColor" cards do. I know they
do 32K colors, but I'm not sure of details. Anyway.)

All of them. Up to 768x480 using normal OS calls. No "supposedly" about it.
>
>Also, if the DSP is going to be used as a modem, where do you plug the
>phone line into the computer? I don't recall mention of a socket 8-)

That's one of those "could-be-done" features; you would need a telephone interface that plugged into the DSP port. I suspect since V.32 modems are already so cheap this sort of thing isn't going to be very popular. (Same argument as against internal modems in a PC - why buy a modem that's restricted to only being usable with one kind of machine, when you could just as easily get one that'll work with any machine? I guess this isn't a worry for some people, since obviously internal modems do get sold, but I'm glad the PC user who previously owned the USR HST modems I have on my Sun went external...)

This Scott guy has the idea!

Computers have no need for such seriousness, unless you are specifically talking about them for serious purposes. I 'upgraded' from my 800XL, to a 520STFM, because 1. The Drive on the 800XL broke, and fixing it was too much hassle. & 2. There was nothing available for it!

I've since gotten 1meg for the thing, and I only use my computer for my own entertainment (and the occassional piece of word processing etc.) Using BBS's etc, gives me something to do - without the computer, I'd be at a bit of a loose end! (I live in a real outback situation).
I enjoy programming, but don't really have the patience to do anything really worthwhile. The occassional alien blasting is a nice interlude.

The whole idea is (as Scott says) - Fun! The Falcon 030 sound, and graphics, etc. will make it a great home computer, and it's use in business wouldn't be bad either (although not ideal).

If people wanted to run IBM, they'd get a 386SX, with a VGA monitor, and fill up their Hard-Drives with various gunk. (Such as single games taking up over 10meg which, even with all the fancy stuff they might do is a bit excessive, due to programmers not bothering to compress, or optimise their code any more than they have to).

If people wanted a nice, simple to use computer, they'd get an ST.
(Or, if they wanted a machine for business, a mac', or for games/graphics, an Am*ga).

Don't compare the machines, it's like saying 'My car is better than yours because it has power windows'. When the person being told about it, has a convertable, and couldn't care less! People will stick with what they have, until something better comes along which they feel happy with!

- If you don't own an Atari, and you can read this, what are you doing
- In this group? Or are you paranoid?

From: ac742@yfn.ysu.edu
Message-ID: <1992Dec5.044255.11088@news.ysu.edu>
Source record: 213847

I will need to convert some SVGA graphics to NTSC video for recording
on broadcast quality BETA tape. Someone mentioned to me that the Atari
ST sported some soert of built in RGB to Video encoder and that I
would be able to export several IBM graphic file types to the ST...
and record them from the ST video outputs.
I know know at all about the Atari ST platform. Can someone tell me
if this information is true?
If so, what would be required to set up a working system for computer
to videotape transfers, using an ST (what hardware/software). How
much would such a setup cost?

I really appreciate any info that can be offered on this topic.

WA>Just so we don't let Dave railroad a wave of opinion, the last time
WA>the argument went through, the biggest PRO-CLOSED architecture point was:

WA> DEVELOPERS KNOW WHAT THE MINIMUM MACHINE HAS.

WA>Some programs use SoundBlaster. No programs use PC-clone DSP boards (and
WA>wont for hundreds of years).
More and more sound cards are being introduced this and next year, most
comments from developers etc. are that the PC abuser is in for a treat.
The GRAVIS UltraSound while not being perfect, offers the user a wave table
synthesizer for about $175 CAN. The sounds from this are getting close to
professional level synthesis. Add multi channel 16bit 44khz digitized
sound playback and record and this comment comes to mind. DSP? Who needs it?

WA>Many programs are crippled to allow them to run on 8088 machines (ie. don't
WA>take advantage of 386 power).

HA HA HA! Most games coming now, STATE plainly that they require a fast 386 at
minimum for all the extended features to run, while some games still play on
a slower machine if the functions are disabled.
Can you say? "Future software compatibility?"

WA>Yet new Falcon programs will be 030 specific and use the DSP if useful,
WA>and have the best sound of ANY home/personal computer.

But who'll support this new ATARI machine? If only Atari had released this
thing about a year ago things would be different. Economics is a crucial
factor right now. DC Softwares closure is a sign of how bad things are.
If I deleveloped software and wanted the most possible return on my
investments.

Can you say? "Over 100 million IBM and compatibles sold worldwide"

WA>They will assume 1M minimum, and more advanced programs will assume 4M
WA>or 14M.

Ah-hah, *pronoun* trouble .... }-)

I kinda figured you meant 16 bits and not 16 colors, but that was after
I had already posted the stupid article.

Somehow I think there's something wrong here, they know that 640x480x16
can't be displayed on a VGA monitor. The docs I read always said to assume
a 640x480x8 screen mode. (It also occurs to me that trying to do fast
page-flipping on an already interlaced display could lead to undesirable
results. Haven't tried it yet, I guess I'll take a look and see what
MGIF looks like on a 1224...) I must admit, it would be nice to see Falcon
running in 640x480 true-color on a Falcon, but at that screen rez the
machine will be only marginally faster than an 8 MHz ST, and probably not
fast enough to handle all of the graphics updating. It would also be harder
to do the blackout and redout effects in the true-color mode, (just need
to update the palette in any CLUT mode...) so I suspect the 8 bit mode
will be more useful for games...

For an eye-opening look at reality, try reading the series
of articles about DSP in the November issue of Byte Magazine.

It details the various DSP products for IBM and Apple computers,
along with software applications and development tools.

>Yet new Falcon programs will be 030 specific and use the DSP if useful,
>and have the best sound of ANY home/personal computer.

>They will assume 1M minimum, and more advanced programs will assume 4M
>or 14M.

That's right... and PC programs assume internal speaker, unless
they auto-detect a SoundBlaster, AdLib, Sound Source, etc, etc,
and automatically adjust to your particular machine..

The "minimum system" argument is what crippled the ST with
Single Sided disk programs that didn't use more then 512K of
RAM for years and years... Dungeon Master for the Amiga was
an audible treat.. because FTL didn't have to worry about
squeezing it all onto a "minimum system" single sided disk.

That's very interesting, considering that the usual reason given
for the crippling of the Falcon is so that it will be
backward-compatible to the ST...

Without the ability to run ST software, the Falcon would be
an expensive paperweight...

>some of which is packaged with the machine!

Yes, and I can tell you I plan to use that two-channel direct audio
to disk program that comes with my Falcon probably twice a day.. maybe
even THREE times a day..!

Gak.. the disk will probably end up right next to the Atari LOGO that
came with my ST..

As long as I'm paying for a DSP (with no choice in the matter), how
about some *useful* software..?

>or making suspicions about my copying morale.

Well, ok.. a couple of things.. (or actually, three things.. I never
meant to imply anything about your morals concerning copying anything)

I used to write software for a "third-party" publisher, and then ran
my own software publishing company. I paid the highest royalty rates
in the Ohio Scientific Instruments computer marketplace and treated
"my" authors with the kind of respect I wished I'd gotten (since I
also was a program author). With that background, I simply don't see
how it's possible to get the kind of direct communication between the
programmer and customer that you are advocating.

What you seem to be describing is virtually identical to the *concept*
of Shareware. The programmer doesn't have to invest in the marketing,
packaging, catalog producing, salesman hiring, etc., etc., that a
software publisher needs to pay for.. instead, he'll get a direct
payment from the computer owner who actually uses his software.

A fine concept, but one which has been demonstrated not to work in
most cases. The end result is that the programmer works hundreds of
hours for free. I too wish there was a better way, but at least so
far, I haven't seen it.

Secondly, I'm all for the free flow of information. I've always wished Atari Corp would have released ALL the information about the inner workings of the ST to anyone who wanted it, so that everyone could have a chance to advance the state of Atari software. Instead they tried to make a commodity out of their information, making potential supporters of their computers pay for the priveledge of helping them sell computers.

There is, however, a fundamental difference between general information about a computer system, and the individual creative works of a programmer.

A company like Atari could give away the information about the ST in hopes that improved software from others would sell more computers for them.

An individual programmer however doesn't have anything other than the code he's generated to sell for income.. if he gives it away, as "freedom of information", he gets nothing for his time, nothing that can pay for food or rent.

And as we're seeing more and more often in the Atari marketplace, if a programmer (or company) can't make enough money to eat, they'll go elsewhere...

>I guess my answer is: I just don't know. There is a long history
>of lousy or medicore products becoming successful while some real
>gems slowly rot away. People are weird.

You've obviously not actually played Wolfenstein 3D.. the game is
a true departure from almost everything that went before it..

To say that it "copies" MIDIMaze is to say that Dave Edson's
"Tube Frenzy" for the Radio Shack Color Computer copies my "FrANTIC"
for the 8bit Atari computer.. I doubt that Jay Wilbur of ID software
would even know what you were referring to if you asked him about
MIDImaze..

In what way is Wolfenstein 3D "lousy" or "mediocre"..? There IS randomness
to the locations of the guards, depending on which path you take through
the tunnels.. as much as there was in Dungeon Master.. was that game
"lousy" or "mediocre"..?

I agree that there isn't much "accounting for taste".. Dungeon Master
on the PC platform has not been at all successful.. (although that is as
much due to the Atari-like marketing strategies of the game company as
anything else..).

Talk to Jay Wilbur of ID, or Scott Miller of Apogee Software, and you'll
learn that Wolfenstein 3D was only an "exercise".. an attempt to see how
their ideas would translate into a game. Their real efforts will be seen
soon in their game "DOOM", which is said to make Wolf3D look like a romp
in a garden...

Lastly, ask them what their plans are to translate ANY of their games
to the Atari platform...

Probably about as much assurance you have today that the "Atari
dealer" who sells you your ST will be in business a week from
today, eh..?

As for getting a CPU or ROM BIOS with your $185 motherboard,
you exercise the brains God gave you and you ASK at the time
you call to order the board, "DOES THIS MOTHERBOARD COME WITH A
CPU AND ROM BIOS?"

If not, then you have to strain your brain and decide if the
price is good enough or not... if you have trouble with this
kind of decision, it's probably not a good idea to go shopping
for a car by yourself...

I don't see where any of that invalidates the PC marketplace..

>Just a question Bob. Do you have a "real job", or are you entirely dependen
>on Atari for a living?

>The answer to that question will imply a lot about the validity of your own
>quoted words.

Indeed.. as you probably know, I *used* to be dependent on what Atari did in this marketplace for my living.. however a certain Atari representative, who had more to gain for himself than for the company he worked for, changed all of that.. (he himself now works for the company I used to, before he interfered).

Thankfully now, my income does NOT depend on what Atari does to this market.. which is the reason I *do not* criticize anyone who is still trying to make enough money to feed their kids from selling products in the Atari marketplace.

So, David.. do you make your living from selling products to the few remaining Atari owners in the world..? Do you therefore know ANYTHING about what it's like to try to pay your rent from the meager income possible in this market..?

Have you recently talked to Charles F. Johnson of Codehead Technologies, or Mike Vederman of Double Click, or Bill and Pattie Rayl of Atari Interface, or any of the few surviving third-party people still trying to scratch out a living from the mess Atari Corp has made..?

The people I work with regularly laugh at me for remaining in the Atari arena.. many of them are long-time veterans of the Atari world, but who have long ago escaped to other, more viable platforms, so they know what's going on.. have you ever stood up in front of an *ATARI* user group and been laughed at when you try to tell them about new Atari products..? If not, it's an experience you should try sometime.. (by the way, are you an officer in an Atari user group..? Or two Atari user groups at the same time..? Have you ever helped organize Atari shows, trying to promote Atari to the general public..? Several shows over many years..?) I know you're involved in the Atari Archive, which is great, but how about involvement with the unwashed masses of helpless Atari owners who have all but

been abandoned by Atari Corp..?

If we're trying to establish credibility here, how many dozens of novice users' questions do you answer in an average week..?

How many "I just bought this Atari ST, and don't know anything about it.. help me..!" questions do you field during an average month..?

The bottom line is that I believe in helping Atari *owners*.. nothing will ever make me believe that I have to help Atari Corp, or do its job for it..

I'd ask "How about you..?", but your previous postings leave little doubt..

To add to the discussion of magazines with Mark Miller..

Unfortunately, what drives magazines is not the popularity of a computer's "market share", but the percentage of advertising they can sell to a particular computer's suppliers..

Subscriptions alone don't pay for a very large part of the expenses in running a magazine.. it's the advertising pages that make or break a publication.. and if an advertising manager calls up companys and is told "We no longer support the Atari platform, please pull our ad", then the editorial departments can hardly continue to print material for a platform which no longer pays the bills...

(I've actually sat with the "advertising manager" of an Atari specific publication and heard those same kinds of comments from her advertisers.. It's a pretty discouraging experience..)

It might be that after having so many other platforms pulled out from under them (Radio Shack, Texas Instruments, ADAM, Sinclair, etc..) when the Atari 8bit market started to collapse, the publishers of Compute! decided not to wait until the bitter end to drop their coverage.. the Atari market had hung on by its fingernails much longer than any of those others..

Like any other businessman, a publisher has to go where his customers are, and give them what they want to buy, if he wants to stay in business. Just call the rolls of all the now defunct Atari publications to see how true that is...

The NeXT box is designed with the corporate mentality in mind, it is not
that easy to get to the "Unix" below it. NeXTStep is all you see.
(I place the word "Unix" in quotes as it is actually a BSD layer above Mach.)

As for the years of work at Xerox PARC, yes they needed to work hard to get the basics of interface design in place, but today we can use thier work as a reference.

It is now a science. HCI is a very immportant part of Computer Science these days. In the case of compiler front ends, the interface design hasn't changed markedly in the last five or so years, none use Windows on the PC (as far as I know).

>
>>Myself I would prefer a compiler

>you is happy with GCC while most of the rest of the world wants
>something more polished and easy-to-use. I'm perfectly happy with GCC
>too, but I acknowledge that I'm not the typical computer user.

I never said I was a "typical computer user" whatever that is. Now, what would you say if a"designer-user-friendly" front end and install program was written for GCC, so that the user couldn't tell what code generator was below it, would that still make GCC worse than Turbo C et al? (This would include a debugger of the sort Turbo C has.)

Anyway, a "typical computer user" would probably not user a compiler of any sort, he would just switch it on and run the same application day after day. Compilers are not for "typical computer users," they are for computer literate programmers, or at least people aspiring to be.

Myself, note this is a personal comment, find the sort of HPI's which you prefer get in my way. They always seem to try to be too helpful and do the precise thing I don't want them to do. Also, all this swapping from keyboard to mouse and back again whilst editing the code, plus having to pull down menus etc is a right pain for me. Give me a nice clean command line and a standard set of programs and arguments any day. :-)

It's not like GCC in that respect, with GCC your input file is identicle to
that you use with commercial "user-friendly" C compilers. TeX is totally
different. I'd put TeX in the same class as Postscript, ie a document
description language. It's just that no-one's written a word processor which
outputs TeX yet.

>unusable by mere mortals. You know what secretaries do when you tell

It's not aimed at those types of people.

>Jeez, why do you think Lamport wrote LaTeX? Because TeX was utterly
>unusable, even for computer scientists! (Not that LaTeX is usable,
>but it's certainly better.)

LaTeX is merely a macro package which gives the user some higher level
primatives.

>
>People want to *use* their software without having to learning much.
>They don't want their documents to look like programs or proofs, and
>they don't WANT to NEED to know what -fomit-frame-pointer does.

The sort of user you are talking about won't even want to know about it, the
maximum normally needed is something like..

```
% gcc -O2 -o prog.ttp prog.c
```

or at most:-

% gcc -O2 -o prog.ttp main.c sub1.c sub2.c -lsomelib

Not THAT difficult.

>
>TeX: free, powerful, overly-complex, arcane. Typical of top-of-the-line
>free/copylefted software.

The most important part of the whole thing is, as you put it, powerful. TeX is not free on the PC, at least PC-TeX isn't. Overly complex... This case, yes, but not necessarily. It doesn't have to be free to be complex.. just look at the programs for networking on the PC. Arcane... surely you mean unfashionable or raw. Would you call a formula 1 racing car arcane, or would you call it a raw tool to win races? After all it has neither a roof, leather seats, electric windows, power steering or a CD playing stereo.

Most free/copylefted software are tools.. the idea of copyleft is to allow the easy distribution of tools and techniques. As such is does a hansom job. No-one expects Gnu-Desktop publisher.... Maybe Gnu-DTP-GUI-Utils though.

6571. Pay for software ???

Newsgroup: comp.sys.atari.st
Date: 1992-12-05 13:40:09 UTC
From: y0000028@rzab0.rz.tu-bs.de
Message-ID: <1992Dec5.134009.16360@ibr.cs.tu-bs.de>
Source record: 213716

Hi there

I' ve read the discussion about copyright and copyleft and I would
like to compare it to the beloved MS-DOS market:

Every private PC-owner I know uses *stolen* software!
Even the OS (DOS / Windows) ist an illegal copy.

Many of them can't affort about 1000 DM+ for some legal wordprocessing
software.
Noone will use shareware or public domain software because on a
compatible mashine you have to use compatible software.

That leads to the question of who buys the programms and feeds lots
of $ (or DM) to Microsoft&Co?
Every comercial user will buy one copy (which BTW reduces his TAX
amound a little) and the criminal empoyees will use the programm at
home, _show_ it to his friends and so on.

There are only few comercial Atari users which have to use legal
copies therefore ther are only few to pay. But many private users
are still honest and pay the $10 to $50 for their shareware.
But they are getting fewer and fewer (the honest one and the total
amount)...

Hoping for a better future
(but not expecting it)

6572. Ghostscript 252b

Newsgroup: comp.sys.atari.st
Date: 1992-12-05 13:53:00 UTC
From: y0000028@rzab0.rz.tu-bs.de
Message-ID: <1992Dec5.135300.16545@ibr.cs.tu-bs.de>
Source record: 213717

Hi there.

I've just copied Ghostscript from our local ftp-site (yes, it still
has Atari files) and it's great.
It reduces my postscript-printing-time by about 40 minutes!
(Well, that's the time to drive to university and back)

There's only one little problem with a HP-Deskjet 500 C.

When printig to a dj500c I can only get about 12 cm (5'') printout,
than the mahine stopps. I believe a whole a4 page of 300 DPI colour graphic
needs about 7.2 MB and the 12 cm is exactly what fits in my 4 MB RAM.

Since I can't upgrade to 8MB (it's just a MEGA STE 4) my question is:
Is there a way to split the picture to 3 parts and print them to one page?
3 x 12 cm = 36 cm > 29,7 cm = a4
Or is there any other possibility of printing a colour picture?

Kevin,
You say "My Atari does everything I want, and if your computer
doesn't, get a new one!"

Well, that's exactly what we had to do; that's exactly what a large
majority of other Atari owners have done. By large majority, My estimate
is that 85% of all former Atari owners now have a different platform
computer, and a good 65% don't have their Atari at all anymore.

That just leaves about 15% of diehards like yourself...hardly enough
to keep vedors alive.

Double Click did not go out of business because of bad decisions --
they wre the only company with a "diskDoubler" type program on the ST,
Such programs on the Mac and PC can maintain a company with lots of
staff;not true on the Atari side of the world.

That certainly is true. I usually spend much more time on the GUI of programs I write than on the "brains" of the program. Fortunately, there are tools out there (not for the ST, I am afraid) that will take a large part of the GUI programming effort out of your hands. Even so, tweaking the user interface takes _ages_.

B>of "UNIX ASV" from Atari, Corp. might take a lesson from that

So what? Visit your dealer, and order a copy of ASV (choose from two versions: either on a 210 MB hard drive or a 340 MB hard drive). You'll need at least 8MB of RAM and a 19" monitor, though.

btw, ASV has been around for about one year now, and about three weeks ago, users were informed about an update to version 1.1. Atari UNIX exists!

6577. GDOS 180*180 driver for Epson printer?

Newsgroup: comp.sys.atari.st

From: aeg03@rrz.uni-koeln.de
Message-ID: <1fql79INN11fp@rs1.rrz.Uni-Koeln.DE>
Source record: 213719

Hi folks,

is there a GDOS driver for Epson ESC/P printers around that will
do the output in 180*180 mode? 360*180 will also be fine, but the
driver I recently tried is for 360*360, which is not supported by
my old Epson LQ-500. I'd appreciate if someone could point me to
an appropriate GDOS distribution.

Greetinx & thanx in advance, Jan

Why not? Analog monitors like the one sitting in front of my face (a Sony 1304) can display a lot more than 256 colors, right? Am I clueless about mointor technology or something? Is it the monitor connector? I'm confused at your remark.

If you meant "on an SC1224," I've actually seen a prototype run that mode on an SC1224, and while it was a bit "glittery" from the interlace it looked pretty good.

>I must admit, it would be nice to see Falcon
>running in 640x480 true-color on a Falcon, but at that screen rez the
>machine will be only marginally faster than an 8 MHz ST, and probably not
>fast enough to handle all of the graphics updating.

Yeah, I mentioned that too; the implication being that they should really consider putting a 33Mhz 68030 in instead of a 16Mhz one. They didn't really pay any attention to this either. The CPU will be underpowered for the screen just like on the ST. (A good benchmark which the ST fails in low rez, for example, is "can you copy an entire screen in less than 1/60th of a second.)

Well Bob, I've played it (won it) and I have to say that it's really not much of a game. Nifty graphics (though lots of cheating; not nearly as impressive as Ultima Underworld, the "other 3D dungeon game"), but the gameplay isn't anywhere near as good as the original 8-bit version. For me, it's got about 3 hours of gameplay in it.

I'm looking forward to "Doom" the new Id 3D game that will supposedly have more stuff to do.

(Followups to comp.sys.ibm.pc.games.)

Well it does irk me that they took the game from Silas Warner's Castle Wolfenstein (published by Muse Software) without giving any credit whatsoever. I don't think Warner was well-known enough to assume that everyone knows he wrote it, so some explicit credit is due, IMHO.

>Talk to Jay Wilbur of ID, or Scott Miller of Apogee Software, and you'll

A terrific idea! Instead of having the typical vague sorta PD/shareware market, put all the good stuff in a catalog which is mailed quarterly to all Falcon owners. Everything comes with a printed manual, everything is in _one_place_. Charge $15 max for all the typical utilities, or maybe even less. Don't charge more than $20 for anything, unless the program is so complex that the size of the manual warrants it.

Somebody send Scott's posting to the the Tramiels. Sure, they'll either ignore or screw up everything, but that's to be expected...

Source record: 213723

The last time I ftp'd the KA9Q from atari.archive, I got a very old
version of this code. It didn't have SLIP (Serial-Line Internet Protocol)
and I think now's the time for me to really beg the net to see if
anyone has such a beast for the ST...

A pointer to an FTP site would be great! Mods to the distributed sourcies
would be good, too. I've worked with KA9Q on the PC, adding services, etc.

If ya wanna know, I'm gonna get a PC with two serial ports, run KA9Q on it,
and allow it to act as a router. This way, I can connect through my modem
with one serial port on the PC to my dial-up slip connection, and use
the ST through SLIP on the other port! Two computers online for the price
of one phone line!

If I get a SLIP-capable KA9Q, I'll be more than happy to help others
set up a similar configuration.

Thanks!

In regards to ISDN, that might be true of a ST but I don't think it will be
true of the Falcon.

Hayes has already written code which runs on the Motorola 56001 which does
ISDN. It's included free with every NeXT allong with a great API for doing
stuff over ISDN lines. Since the DSP in the Falcon has *more* memory than
the NeXT version, I don't think there would be great problems getting it
running on the Falcon. All you need on a NeXT for ISDN is a ISDN line and an
adaptor.

Hunh? What do you mean by "hard to get to the UNIX". Typical UNIX programs can be compiled easily on the NeXT (esp if it has X). You can open a terminal window on a NeXT just as easily as you can on a SUN. So what did you mean? I don't see any real reason to say "Unix" either. Sure there is something under the BSD layer...but unless you really want to use it...it doesn't matter. Mach/BSD *is* Unix.

I know that this is off the beaten trail of the topic...but I saw that "NeXT" word...(so I want one and I'm not rich enough. Sue me.)

>What would you have thought of a compiler package which had a brilliant
>front end but produced code which was erronious and ran slower than an
>interpretted BASIC?
>
>Would this be a good package too?

The point is not whether or not *I* would think it would be a good package -- we're talking about everyday mainstream computer folks here. You mention BASIC; I think the fact that BASIC is still very popular in the Atari world is an indication that many people will accept technical inferiority (e.g., not as good code generation, etc.) along with ease of use.

(Now let's not get into a big argument about BASIC vs. C. I doubt there's a BASIC compiler out there that generates GCC-quality code, but it's not relevant 'cause I'm just giving an example.)

>It is now a science. HCI is a very immportant part of Computer Science these
>days. In the case of compiler front ends, the interface design hasn't
>changed markedly in the last five or so years, none use Windows on the PC
>(as far as I know).

Well I don't agree with your first claim there, but even so, it's still true that an enormous percent of the code for applications is strictly user interface garbage. So in terms of the *peoplepower* required, the interface is definitely a huge part of any commercial package. (And I still claim it's harder, in many cases, to get right.)

>I never said I was a "typical computer user" whatever that is. Now, what
>would you say if a"designer-user-friendly" front end and install program was
>written for GCC, so that the user couldn't tell what code generator was
>below it, would that still make GCC worse than Turbo C et al? (This would
>include a debugger of the sort Turbo C has.)

This argument was NOT about the quality of GCC. GCC was an *example* of how copylefted software never matches up to commercial offerings in ease-of-use, and hence will never replace copyrighted stuff in the marketplace.

The "typical computer user" is the one who determines the success of products in the marketplace, not people like you. That's all I'm saying here.

Finally, IF someone WERE to add a Borland C-ish front end to GCC, then SURE, it would be better, provided it was done as well. But

no one's done that yet, and that's exactly my point: These things
take time, and they're hideously boring for techno's like the FSF
and you and me. So for copylefted software they never get done.
That's why copylefted software taking over the mainstream is
a pipe dream.

To really this back in to the topic at hand: The claim that people
will contribute enough to copylefted software (i.e., for free) so that
such software will become competetive in the mainstream is unrealistic,
as we have seen in the GCC case.

If someone does as you describe, and adds easy-to-use whiz-bang front
ends to Emacs, GCC, TeX, etc. then I won't have nearly as much ammo
to aruge my point with, admitted. Fair?

>Anyway, a "typical computer user" would probably not user a compiler of any
>sort, he would just switch it on and run the same application day after day.

I still think there is a distinction between die-hard Borland users
and die-hard GCC users, but your (and Howard's) points are well-taken.
Emacs and TeX are better examples I think.

>Myself, note this is a personal comment, find the sort of HPI's which you
>prefer get in my way.

Me too, generally, though I really do like Borland's source level
debugger.

>Give me a nice clean command line and a standard set of programs and
>arguments any day. :-)

Ditto. But I don't think we're typical.

I realize that. I don't agree w/ everything Atari does. I know it they have problems. IF my ST didn't do everything I want it to do, then I will get a new computer. When I buy the FALCON030 (Mainly for it's sound qualitites) I expect it to do everything I want it to. When that computer gets old, if the next Atari computer doesn't do what I want, then I will get a different platform. Through the 80s, hundreds of computers came and went (Remember the Adam?), and Atari still stood. I expect them to continue to stand during the FALCON years too. The point I wish to make, however, is that it doesn't help to hear "We are going to leave ATARI, we hate ATARI" over and over again. If you are going to leave, LEAVE. There are many who have been whinning since the STACY days. They cried about the Stacy, STE, MegaSTE, TT, and now the FALCON. I get tired of hearing these people whimper about ATARI. Atari needs to get a larger userbase and what do you believe people thing when they read this group, STR, and others? "...a bunch of babies I don't want to get involved with." Like other companies, Atari needs users who don't care about the managment, just users who cares about the computer. If Atari doesn't satsify your needs, get a nother computer, we don't need to hear the unproductive commentary over and over....

This attitude is is certainly not unique amongst the Atari market.
Every time someone tells me they are going to buy a PC I ask why.
First, they'll say something like "well the 486 is a really powerful
machine". I ask if they considered a low end Sun workstation. They
say "No. the software is too expensive." (TRANSLATED: I would have to
BUY the software for a workstation.) I ask them what kind of software
are they looking to run. They list the usual stuff. I then say that
98% of the software they intend to use would run fine on a 386SX
machine and with the difference in price they could buy the software.
Some usually figure out what I'm getting too and change the topic of
conversation. Others will actually state that they don't intend to
purchase software, that their main motivation for buying this PC is to
use the software they can take from work. When I tell them that this
is software piracy which is just another form of theft, they usually
are offended and respond with "Are you calling me a thief?". Hey, if
the shoe fits ...

I've been looking for a STE demo called 'Mental Hangover' at several
ftp-sites, but I still haven't found it. Does anybody know where to
get this demo from? Thanks in advance!

** Hows is this for Support **

I brought a second hand copy of Diamond Back that I new was out of
date..

So I new that Bob Luneski, so I left a open message here about
upgrading my copy of Diamond Back..

Some 3-4 days later, from memory, Bob Luneski go back to me
as a E-Mail, mentioned all the options on how to go about upgrading
my copy..

So some 3 days later I Faxed my copy of Diamond Back, with details of
credit card etc..

I did have some problems in getting the disk to fit into the
Fax machine though..:-)..

A vola, 2 weeks later the New Diamond Back disk was in my Mail Box...

*** How is that for support..!!!. ***

Good on ya Bob...and Oregon Research Associates...

I wish upgrading my copies of Touch-Up from Migraph would be that simple
and fast...

From what I have read, I need a letter from the Previous owner, that I am
now the rightfull owner, but the problem there is, that this chap is now
working in Vietnam..!!!

Hmmm. You can have a lot of stuff that plugs into the DSP port on
the Falcon030.

You can have a modem, a voice mail system, etc.

The problem is, there is only one DSP port. You can't have all of
them hooked up at once, can you?

Those that complain about how Atari users are still using BASIC (the inference being "Grow up, and use a REAL language!") should keep in mind the factoid that even in the I*M market, they've been upgrading BASIC.

Microsoft actually has TWO notable products; the "standard" QuickBasic that's an upgrade (a BIG upgrade) from the classic GW-Basic. It's not one of their big products; but it actually does get used when non-programmers want to do some programming. (My father's department did some software development in QB last year. They're basically accountants. It wasn't anything big - the program could probably have been hacked up quicker using HyperCard on a Mac. Oops. They don't have Macs.)

The more notable thing is the recent "Visual Basic," which seems to be a GUI rapid-prototyper.

At any rate, it's not COMPLETELY stupid for there to be Atarians still working in BASIC. 'Specially when there's a GFA Basic that runs under MS Windows.

This should not be misinterpreted to infer that I actually use BASIC for anything :-). ANSI C/Perl/Forthmacs all the way...

I'm not so sure that a "game machine" isn't a bad idea.

Just think how many Amiga 500's were sold for games.

Just think how many C64's were sold for games.

Just think how many IBM PC clones were sold for games.

If I was Atari, I'd try to out do everyone when making a system
for a purpose being entertainment.

It sells!

6598. Cleared Harddisk...Help.

Newsgroup: comp.sys.atari.st
Date: 1992-12-06 02:18:06 UTC
From: ggreenbe@rodan.acs.syr.edu
Message-ID: <1992Dec5.211806.19476@newstand.syr.edu>
Source record: 213742

Short version:
I did something really stupid. When using ICD Format to try and redo a partition on a removeable, I accidentally hit CLEAR. Now the entire syquest platter shows no programs...I believe the programs are still there. Is there any way to get the directory to them back?

Long version:
I did something really really really stupid. I cleared and entire syquest platter with the CLEAR command on ICD Format. I've got a Syquest mechanism hooked up through an ICD FAST drive. The cartridge in question is partitioned into 2 21 meg partitions. I was having trouble with one, so I was trying to fix it. While looking at the partitions from within the Partition part of ICD Format, I hit the CLEAR button, which seems to have cleared the directory (directories) for the entire cartridge. I'm pretty confident the programs are still there...at least some are still visible when looking at the disk with a disk editor.
Anyway, is there a way for me to fisk the drive? i.e. recover the directory (or whatever it is that was cleared)? Or do I just bite the bullet and start reloading everything? [I don't reacall the cartridge being accessed, which is another reason I'm pretty sure the files are there...but obviously something was destroyed!]

I will be very happy to receive any advice on this problem.

The flaw in this reasoning, IMO, is that it is an "all or nothing"
argument. Sure, it's bad when your *only* motivation is making money.
It's also bad when you have absolutely no interest in making something
commercially successful. I think there is a realistic middleground,
where highly motivated programmers can produce art yet still make
money, without either extreme winning out. If it turns out that
you can't make money from your art, you just give up and do something
else.

But does it swallow? :-) (obligatory stupid smiley face)

Besides, you make such an ELOQUENT case for the fact that the Falcon sucks.
I'm very impressed by your technical knowledge of the Amiga and the Falcon and
the fact that you're able to recommend the best computer for anyone to buy,
regardless of what they plan to run on it.

Now go away and STOP trying to start stupid flamewars between the Amiga and
Atari newsgroups. comp.sys.amiga.advocacy is already a massive waste of Usenet
bandwidth, not to mention my disk space.

he wrote wasn't very important..)

Gosh David.. you know, it would probably make your life a lot
more interesting, and certainly a lot less confusing than it
seems to be, if you learned how to read in context.. you know,
like most people do.. you start at the beginning and read all
the words until you get to the end. Then you stop.

It's also usually a lot better if you only read the words that are
actually there, and not clutter up your mind by imagining words that
really aren't in the sentences you're trying to read. Makes it
confusing for people who try to understand the things you write back.

Really..! It works great... give it a try sometime..

By the way, you still haven't told us where it is that you can buy
a Falcon.. or is that your little secret..?

>Yeah, so we shouldn't be surprised that the graphics are good but the
>game sucks! :)

Yeah.. that's essentially it.. it looks like Wolf3D could have
been a "trial balloon" to see how the game engine appealed to
players... essentially it's nothing but running through rooms
and tunnels, shooting anything that moves, with a few gratuitous
"adventure" items like finding keys thrown in..

But it's such a departure from the "overhead" Ultima style
games, and it's even an improvement on the "Dungeon Master"
first-person perspective games, that they've had orders for
the entire set of six episodes backlogged.. they can't ship them
fast enough to satisfy the demand...

Sadly, I can't run Ultima Underworld to compare them.. I need to
get one of those $185 upgrades for my '286 so I can run it...

:)

L_____() chan@cs.unr.edu \/^

System for SALE:

This is a whole system. The printer and modem may be separated.
Everything is close to mint for I value my things with high regard.
The internal HD is backed up! My setup is based on NeoDesk... nice setup
with software accelerators and other enhancements.

MegaSTe4/50MBHD with SC1435 monitor was bought 8/91 after sale of my 1040ST.
I bought those two items alone for $1800.
I bought the printer for $200.
I bought the modem for $200.

Note: software accumulated for over 6 years (when I had my 1040ST). Value
is hard to judge... retail (estimated) > $3000 (???).

Items:

Mega STe: 16 MHz 68000 Motorola processor, (optional) 68881/2 floating point
coprocessor, 4 megabytes of RAM, ST LOW/ST MED/ST HIGH resolutions, 4096 colors,Midi I/O,
WME-compatible Eurocard expansion slot, monitor port, RF modulator
(TV) port, parallel port, serial port, (2) RS232 modem ports, floppy disk port,
LAN interface, ACSI DMA port, ROM cartridge port, mouse/joystick & joystick,
stereo R/L ports, detachable 95-key intelligent keyboard (own microprocessor), 50 MB hard
drive (internal), double density floppy, mouse.

ATARI SC1435: 14" diagonal, ST LOW, ST MEDIUM, internal stereo speakers,
headphone port, monochrome (green), swival base.

CITIZEN 200GX: color on command, 3 built in fonts, manual load, form feed, Epson compatible, many options, (included: ~800 pcs. printer paper, ribbons).

SUPRAModem 2400: 2400 baud rate, external compact unit.

SOFTWARE (most on 50 MB hard drive):

NeoDesk 3.02, Flash, Procopy (all versions), Word Writer ST 2.0, Print Master, Typing Tutor, Mark William's C, Art and Film Director, Music Studio, Quick ST, Desk Manager, etc...

Public Domain: tons of .MOD files (amiga stereo sound files) => ~ 12 MB's worth, tons of games, tons of picture viewers, MOD players!!!, tons of pictures (SPC, GIF, PI?, NEO, TNY), tons of utilities, tons of this/that, tons of demos (ST/STE/excellent sound/graphics), tons of everything of hard drive/backed up/and disks.

Commercial: 10th Frame, Airball, Arkanoid, Balance of Power, Elevator Mission, Barbarian (2 versions), Battleships, Beyond the Ice Palace, Captain Blood, Buggy Boy, Carrier Command, Championship Basketball, Championship Wrestling, Chessmaster 2000, Falcon, Flight Simulator II, Hardball, Hollywood Poker, Strip Poker, Ikari Warriors, Jet, Karate Kid II, Leisure Suit Larry in the Land of the Lounge Lizards, Live and Let Die, Lost Duchman Mine, Manhunter: New York,Marble Madness, Match Point, MidiMaze, Temple of Doom, Metrocross, Millipede, Joust, Floid the Droid, Oids, Paperboy, Pinball Wizard, Prohibition, Psion Chess, Road Runner, Star Trek: The Rebel Universe, Space Harrier, Space Station Oblivion, Speedball, ST Vegas, ST Pool, Leather Goddesses of Phobos, StarGlider,Super Cycle, Super Sprint, Temple of Apshai Trilogy, Terrorpods, Test Drive, Tetris, The Guild of Thieves, Tower Toppler, Typhoon Thompson in Search for the Sea Child, Winter Games, Zany Golf.

Oh no!... NOT again... lit'l amiga user wandered into the newsgroup.

Please exit stage left!

(though I am not saying that Atari is any better anymore...)

Actually, I've been an ST user for TOO long... when the 1040ST
came out!... approx. 1986.

I've said to myself, 'Oh, they'll come through'....

MegaSTe? what's that? 520? 1040? Tt? St Pad? St Book?

Stacy? MegaST?

Advertising? Oh, they, (atari) don't believe in it...

Strategy? what's that?

The ST is a hell of a computer! But, it'll become an orphan soon...

PC's. Intel... finally going to redesign they're chip....

About time! (5)...

GOod luck folks...

I'll end up with a PC, probably... (slow machine)

Never an AMIGa... shitty desktop (oozing shittin' shit).

Mac... to high priced...

Falcon...? Damn game freezes on my new MegaSTE! Other than

that, shit, Falcon computer... THERE won't BE any support...

TOMBSTONE:

ATARI could have been great!

d> your program," will call me at all hours asking for free technical
d> support or custom modifications? No, again. What to do? You tell us;
d> we haven't decided yet.]

Well, I've watched your occasional releases (thungs like Snowball fight and Blox and so on) with considerable interest - the GWB sounded, and looked, like a pretty nifty solution to the average aspiring gamewriter's problem of 'how do I do X?'.

If it's ready to release, then I'd say do it - even if only by mail-order. Don't put the docs on disk, for obvious reasons 8)

I thought Blox was "pretty neat", and a lot of people were impressed when I showed it off at them - the idea blew a few minds. I just never played it seriously...

d> Frankly, I place most of the blame on Jack's brats for being so utterly

Well, given where I live, that's hardly likely, but if the people they hire reflect themselves, then I know _exactly_ what you mean.

d> Atari zealots always say this, but I really can't imagine how anyone
d> could come to that conclusion after having extensively explored the
d> free/shareware scene for PC's and Mac's. Sure, some pretty nifty
d> cheap/free software runs on the ST, but equivalent (and often better)
d> things run on PC's and Mac's. E.g.,:
d>
d> ST PC
d>
d> MiNT Minix, 386 mach (w/4.3 Unix emulator)
d> ??? X (under mach)
d> Gulam 4-Dos
d> Gifshow, etc. Cshow, Graphics Workstation, etc.

d> Llamatron Commander Keen IV, Wolfenstein 3-D
d> arc, zoo, etc. All these and more
d> GCC djgcc
d> gnutils Gnuish project

Hmm... There are some things you've left out of both sides of the list there dave - I'd be a little more careful than that...

MiNT is more closely comparable to DesqView than anything else - Minix is on both platforms already. Linux on the PC is very nice, but has no match...

There is still nothing that comes near to matching something like Gemini for the PC.

djgpp inposes some _very_ strict limitations on your operating environment, although it has some commensurate benefits.

There's a lot more than that to it - it's more of an attitude than anything else in many ways - as you said above, almost religious. I do have to program for PC's day in, day out, and it's quite painful in contrast to coming home in the evening, switching context and writing for the TT. It's not due to me working on my own project - I'm enough my own boss at work that I'm pretty much in control of what I write.

I've tried rather hard, with the help of the largest BBS in the southern hemisphere (ADAM), to get my system at work tweaked to the point where I don't have to cringe every time I use it - but little things like being limited to the video modes my mouse drivers support, fighting painful memory model limitations, similar annoying OS and hardare bugs to the ST and so forth make it still a much less comfortable development environment than a TT with the gnu fileutils, micro emacs, and a nice compiler.

(reads above - hmm, I do drivel on... I guess I was trying to say why I would have great problems living with a PClone as my only computer...)

d> It's amazing to me how the FSF has brainwashed so many intelligent
d> people into thinking that, on a grand scale, this is 1) feasible and

BB>
BB> ALL the peripheral cards just pop back into their slots, the
BB> motherboard lines up with all the case openings (ie: I don't
BB> have to hack the case to make the upgrade fit).

Depends on which 'standard' your motherboards and case follow for mounting
holes. If you're lucky, your motherboard will be one of the multistandard
ones, you know, the ones with about 30 holes in them.

Not only that, if the XT motherboard is one of the 'baby XT' boards, based
on the Ferranti chip or similar, you may have to maul some of the case
metalwork anyway.

BB> OK, sure it's still got an 8bit MFM drive controller.. the point
BB> is that I *can* upgrade to an IDE or SCSI controller LATER, when
BB> I've got the cash.. and when I do upgrade the drive and
BB> controller, I don't have to hack and slash to get it to fit, or
BB> work.

But your 8bit controller card will probably not work anyway - unless you are
very lucky. If you don't know why, I don't think you have the background to
make it worth my while explaining it to you.

It's also likely that your XT was running the bus at 4.77, so most of your
other cards won't work either. There's also a good chance you will want,
eventually, to put a "real" AT size card in your XT case, and you will be
suitably pissed off to discover that it won't fit, coz XT cases are a little
shorter.

You forgot that you probably need a new keyboard as well, seeing as XT and
AT keyboards aren't compatible.

BB> If an Atari owner CAN'T afford a TT or Falcon, he CAN'T upgrade
BB> his computer (other than the "hack and slash" method).

And a PC owner who thinks they can keep upgrading 'forever' by buying a few bits here & there is like an oldtimer dreaming about putting mags and a turbo rotary in his model-T ford.

So far, I think howard's claims stand rather well. (oh, you forgot to mention which power supply your XT has - your new 386 may need a bigger one as well).

the time lag between a book's publication and its availability in the
library is due to the simple fact that libraries have budget constraints.
given an unlimited budget (and space :-), libraries would have every
book as soon as it was published.

Hi Tim! This statement puzzled me, because I had just checked last night that the files gsfonts1.zoo and gsfonts2.zoo were still on a.a. Just checked again a couple of minutes ago and they're still listed in the Ghostscript directory. I had ftp'd these fonts a couple of weeks ago and put them on my MegaSTE at work. I don't know enough about gs fonts to know whether these are the newer fonts you refer to.

Anyway, I decided to get the big (1,636,075 bytes) font file from prep.ai.mit.edu. Have put a lot of effort into untar'ing it (on a VAX/VMS system!). Due to account limitations, I had to do the untar'ing in pieces, i.e. file by file (couldn't manage to get my tar, in POSIX, to recognize wildcards). The bottom line is that I now have four .ZOO files, taking up about 1.5 Megabytes of disk space; these contain all 77 font files in the original .tar.Z file on prep). I plan to d/l these to my ST tomorrow (probably) and will likely have to delete them from the VAX very soon afterwards.

The thing is: should I u/l these (presumably newer) fonts to a.a.? The way I've split the fonts into the 4 .ZOO archives is pretty arbitrary - it was just a matter of how I could work out the logistics, given the space constraints I was working under. Any comments, anyone?

>
>Nobody ever sees or uses vaporware.

1) I assume that since you have no factual comments on the subject at hand that you concede your point. Good; we won't have to go all through it again more slowly.

2) Assuming you actually had some fuzzy idea in your mind about how GW's status relates to the comments above, as opposed to what I think is the case -- that you just wanted to push the right buttons to irritate and sadden me (and Neil, BTW, who's never said anything to bother *you* here in all the years he's been reading this group) -- I can only assume you're trying to compare my *criticism* of the Falcon's mythical DSP vaporware to Game Workbench, whose status you see as similar.

The point is that no one's going to be buying a Falcon on the basis of having GW or not. It's not something *required* to support the hardware. The DSP is useless without decent software support. Hence the fact that the DSP software is vaporware (unlike the 80x86 DSP card(s) software, which you can buy now and use for dozens of *useful* applications) only supports my criticism of the Falcon's closed architecture. If you want to run DSP applications, you MUST use the DSP in the Falcon. You can't put a board in and run another *with software* as you can with PC's and Mac's that can take cards.

3) DC's going bankrupt made it awfully hard for GW to come out, eh? It needs a ~500 manual. It needs good user support. Or have you totally failed to make the connection between GW's not coming out and my frustration with an Atari community that just wants to grub up DC's software for free now that they've gone under?

4) GW is real and some people reading this group have used it extensively. (You've already read a post that gave a first-hand account.) You may not ever use it yourself, but that will only be because the market you defend like a religion isn't healthy enough to support a several hundred dollar development tool any more, and I'll be damned if you get 4+ years of my work for free given the kind of backstabbing "milk the developers for all their worth and them bust 'em in the chops" attitude I've seen here lately.

NO ONE here has used any substantive Atari DSP software. We're not talking about a little demo that puts effects on your voice (the Hippo sound digitizer software has *that*) but some real, useful software. Neil has a Falcon NOW, and he's had it for months. It's not like I don't know all about the machine and what developers got with it, OK?

5) You've "seen and heard how many people want to get their hands on [Game Workench]." OK, do you think they're willing to pay the several hundred dollars it's worth to "get their hands on it?" If not, then this overwhelming demand you cite is utterly uninteresting.

For the sake of everyone's sanity please try to be mature enough to not take negative comments about your favorite computer (which, I might add, I've supported a hell of a lot more over the years than you) as some personal attack. Dragging me or GW through the mud doesn't help your case any; it just shows that you are either too upset to argue your points clearly, or have nothing real to say but still want to get in the last word.

Ok, this is what really bugs me. I was really looking forward to purchase one after using it at the Chicago show. Well, it was kept being pushed back, and pushed back, so I found a really good deal on a Mac PowerBook, and bought it.

I bought the 100, which doesn't have a floppy, but I rarely miss it. (I do have the external floppy, but I don't use it that much.) It is really not that hard to use a notebook computer that doesn't have an internal floppy!

> Falcon030, due on limited quantities sometime over the next two weeks to
> US dealers. Europe is already seeing small supplies enter the area.

I'll just reiterate what I've heard before, the falcon is too little and too late. (When this was announced I thought I would hold off on buying a computer, but since I dodn't see my chance until next year, I bought the Mac)

Well, its time to crawl on the soapbox here. (And as you read this, just remember I am a very big Atari supporter, I talked my parents into buying a ST back in '87, when they wanted to get a MS-DOS machine!)

System 7 on the Mac is one of the best pieces of software on any machine I've used. To install a font, you drag it to the system folder and its installed in the proper place. The same thing with control panels and extensions. Cooperative multitasking is not the best thing in the world, but it beats what's available for the ST. (No slams on MiNT,

I've used it a lot on my 1 meg machine, but it still doesn't do GEM prgs.)

I'm also lucky to be going to University that is very big on Macs. If I want to print anything, I go up and plug my PB into the Appletalk network, and then I get print wherever I want, and also access file servers, and FTP directly to my hard drive. This interconnnectability is something that Atari needs to work on, and it needs to come with the system software, not purchased as an add on. (The same with the outline fonts.)

Well, I know I'll hear all sorts of warm fuzzys on this, so I'll end now, but since the purchase of my PB I've only used my ST as a terminal, and do everything else on the PB. (If I had a modem cable, I'd probably be using my PB for that too.)

Atari needs to wake up and ADVERTISE!!! If a kid sees a falcon on TV, he will run to Babbages and ask if they have one. Look at Nintendo, their equipment is nice but not state of the art (6502 and 65816, and the GameBoy) but they advertise and sell millions of units. (And they are very good at manipulating the young populace (just look at the magazine Nintendo Power), and they know if they get the kids to bug their parents, the parents don't understand anything, so they just purchase it blindly.)

Later.....

Dave. Did you ever wonder why the PC format got to be so popular? It
wasn't brilliant marketting or superior hardware, it was because people
could get all the software from work for free. And dealers would
happily load the machine with a ton of pirated stuff, just to make the
sale.
You might be able to say that piracy killed the ST, but it was the
piracy on other platform(s).

>them hooked up at once, can you?
>

I don't see why not. Both are going to use the same telephone line connector box. It's all a question of which software is controlling the DSP at the time. And I'm sure (market willing) that someone could make a front end program to hand off control to voice mail/BBS/fax software, depending on the type of call.

6621. One head isn't better than two

In the last few days my internal floppy disk drive had stopped working.

It just refused to read any disks at all so I took the ST appart to see if I could work out what the problem was (which I couldn't). I then tried replacing the drive with the original ST single sided disk drive (the internal drive was a double sided one I put in some time ago). The original ST drive worked OK and quite by accident I discovered that the replacement drive that I had in did work - but ONLY for single sided disks. It still refuses to read or to format double sided disks.

Any ideas as to why the drive should stop recognising double sided disks ? My guess is that there is a break in the cable going to the floppy disk drive but any other ideas would be welcome before I try replacing the cable.

Thanks

Geoffrey

Actually, it doesn't quite work that way...

In the PC market, the number of "buyers" is greater... but so is the number
of "sellers", so there should be no net profit increase. In fact, I'd expect
a very good response for a very good program, and a very bad response for
an average program.

Ohh.. Well if it is compatible, I guess its not that bad.. sorry, I get frustrated once in a while.. you guys understand, your all ATARI users.. Now I'm back in my "Long live ATARI, who cares what we don't have, look at what we have" mood.. I'm sorry for my outbursts, of "I wanna be like IBM".. I know I really don't deep inside, I like ATARI too much.. Lets hope this Falcon works out, and I'm gonna help out.. I'm learning C and hopefully will become an ATARI developer once I know enough! I think we should all right our software, forget Word Perfect, etc.. Although with the Falcon they may come back.

When I get a Falcon 030 the first thing I'm getting is the Falcon SCREENBLASTER, for increased resolution. I'll try to write games that support it and other cards.. Be like the IBM platform where you can choose what you have added on, but better..

GO ATARI!

>Mega.

Wierd! If GEM cheats by changing the directory, then calling the application
when this is done that explains things, but I was always lead to believe
that GEM passed the full path name to Pexec in which case there is no legal
way that Zoo could know where it was called from, and therefore impossible
for it to behave in this way.

>Hasn't this happened on your system? (Leo?)

Never tried it - I always use a shell.

>Maybe my ZOO.TTP isn't current. It does have the "high compression" option.

Unless you have some unofficial inbetween version then any version that
supports "high" compression has every feature and no bugs.

OS/2>
OS/2> btw, ASV has been around for about one year now, and about three weeks ago,
OS/2> users were informed about an update to version 1.1. Atari UNIX exists!

Yes, it does exist. The only problem is that you have to sell your car
to pay for it. Who in their right mind is going to buy a low-budget
computer like an Atari TT and then go out and spend roughly the same
amount (plus or minus US$500 or so) for an operating system? It just doesn't
make any sense. That is our old "friend" Atari...snatching defeat from
the jaws of victory again.

If you have a 3/486 machine, you can get unix for FREE! Yes, for FREE!
Hop over to your nearest mirror site and get (using anon FTP) BSD386
or Linux. Both come with full SOURCE. If you want something a little
more polished, try Mark Williams Co's (Remember them? They used to
develop for Atari.) Coherent for the tune of US$99.

Regards,

Chris

Source record: 213671

dmb@rice-chex.ai.mit.edu (David Baggett) writes:

> Copylefted means "no one can charge for."

Dave really doesn't know or care anything about Free software. Here is text
from the SECOND PARAGRAPH of the GNU GENERAL PUBLIC LICENSE:

When we speak of free software, we are referring to freedom,
not price. Our General Public Licenses are designed to make
sure that you have the freedom to distribute copies of free
software (and charge for this service if you wish), that you
receive source code or can get it if you want it, that you can
change the software or use pieces of it in new free programs;
and that you know you can do these things.

(Note, that the above is a QUOTE from the GNU GENERAL PUBLIC LICENSE",
and the GNU GPL is :

Copyright (C) 1989, 1991 Free Software Foundation, Inc.
675 Mass Ave, Cambridge, MA 02139, USA
Everyone is permitted to copy and distribute verbatim copies
of this license document, but changing it is not allowed.
)

Read it some time. All of you.

The biggest intent of the GNU GPL (to my eyes), is to replace the concept
of Public Domain, which in todays world of patent/copyright litigation
simply DOESN'T WORK.

No-one should produce Public Domain software. Public Domain means people
who take your code can make a few changes, fix a few bugs, then sell a
compiled version of it, and not tell anyone else about the changes/fixes.
Quite soon, your PD version will be unusable (as they can also slightly
modify any protocol you use), and people will buy the slightly improved
version - and pay and pay and pay. Even if you bring out a new version,
they've probably patented their modifications, so you CAN'T be compatible.

You're screwed, everyone is screwed.

By all means, produce commercial software. Produce free software (GPL'd,
or some other flavour you design). Just don't produce PD software (except
for the trivialest of programs).

Source record: 213698

I am sure I am not the only one who is getting rather annoyed with Roger recently. Of course everyone makes mistakes, but why does he insist he is always right, whatever anybody says?
For example, in the case of PFX-packed ACCs more than one person has said that they use them everyday, but Roger maintains that this is impossible - does he think they are lying?
Even they are lying it is not necessary to resort to personal insults (not that being 15 is anything to feel insulted about).

Look Roger, you have contributed usefully to this group in the past, but your PFX postings are not useful - SHUT UP.

- Leo

PS. I do not expect to find 500K of insults in my mailbox tomorrow morning :-)

dmb@case.ai.mit.edu (David Baggett) writes:

>warwick@cs.uq.oz.au writes:

>>When someone posts a cost analysis of a 386DX@25MHz, with DSP board
>>eqivalent to a Falcon's DSP, VGA, serial, parallel, 4 games ports,
>>SoundBlaster Pro, and Windows, you'll have something that almost
>>sizes up to a Falcon 030. Not in price though.

>You can get a 286 with everything you
>listed above (apart from the DSP) for about $750 *including a
>monitor*. (Weren't figuring a multisync monitor in for your Falcon?)
>If you want a 386, add $185 for a 386-33 motherboard. If you REALLY
>want me to, I'll post Actual Real Prices from this month's PC sources.

>I have no idea how much an equivalent DSP board for the PC would be,

Nicely forgotten, Dave. Try $1000 to $3000. Try reading this post
that Ben Gilbert pointed out:

* I will sell to highest offer a Spectrum 56001 System Board (in Europe,
* that is a Loughborough Sound Images 56001 System Board), a dsp card
* for PC computers.
*
* - 20 Mhz Motorola 56001 DSP
* - 3 x 16kW 0 wait state memory
* - 16 bit stereo audio I/O
* - telecom interface
* - monitor & debugger
* - "C" drivers
*
* I got it as a lottery prize(!), but don't really have use for it.
* Hence it is fully unused (but I opened the package just to see what
* is inside). A $2495 value, will go for the highest offer...

So, there's the price:

Falcon: $800
386etc: $750 + $185 + $2495

Assuming you already have a monitor, or are happy with a TV Falcon Output.
Monitor costs vary from $200 to $500, I guess.
(note that the above DSP board is much more primative than the Falcon DSP,
on specs. But we'll say that's made up for by the couple of additions)

>This may be true in Australia (not being facetious here),
No, just totally fallatious.

Message-ID: <1fucerINN5hq@golem.wcc.govt.nz>
Source record: 213676

Is there a simple program out there, that will do a GOOD (e.g. high quality) conversion of GIF (Graphics Interchange Format) pictures (Any config, CGA, VGA etc. 320*200, 640*480 etc.) Into RAW format.

Apparently there is a program that converts GIF to PBM, and then PBM to RAW or some such thing. If this works, without noticable loss of quality in the double conversion - where can I get this particular file? (Or one that does the same trick)

Has anyone registered their 'Photo-Chrome' and gotten the GIF conversion function? Any good?

Replies in E-Mail please, unless they're really informative!

Source record: 213675

The problem with the Falcon's DSP is that just like putting MIDI into the ST, it's a really great and innovative idea. I don't think even the most ardent and arrogant Apple, IBM or Amiga supporter will deny that. However, the cat's out of the bag so to speak. Within a year, there will be equivalent inexpensive DSP boards for everybody else. The market will force this to happen if DSPs become popular. Hell, if no one does it, I have a friend who _will_...

No, this posting does not support your claims. It only means that
somebody was selling a very expensive board. I can go into the computer
shopper and find some very expensive VGA cards in the $1-2K range, but
they are that expensive because they are specialty items with hot rod
parts under the hood for CAD people and such. However, I can also find
tons of cards in the $89-300 range which are also very good and serve
the purpose of 99% of PC users.

I'll wager that the card that is mentioned in the ad you captioned
when placed in a 3/486 box would beat the pants off of the DSP
```

setup in a Falcon. :-) You get what you pay for.

Source record: 213688
Cross-posted to: comp.sys.amiga.advocacy,comp.sys.atari.st

Deduction - the message was cross-posted to the Am*ga group.

I've also never seen a non-amiga user leaving such pathetic messages.

I also never said that everyone that dislikes atari owns amiga, although
virtually every amiga owner dislikes atari (that I've met) due to the
fact that once upon a time, atari was outselling them! (And was voted
computer of the year about 5 years ago)

Anyway, I'm not interested in this anyway. The poster was obviously
of their own opinion, which they're entitled to, although why they must
post such an opinion to multple groups, I don't know!

I was just considering that the DSP could allow the compression of files on the fly. Instead of having to ZIP, ZOO, ARC or LZH my term program could send it throught the DSP automatically if it hasn't been compressed already. If communicating with another Falcon, it would be automatically uncompressed at the other end. In fact, programs like Data Diet could become much faster (not that it isn't plenty fast now).

Hmmm...would also seem to me that DSP could be an ideal crypto device for encoding/decoding messages...with the right algorythm we could all use are Falcons to drive the NSA nuts.

I've talked with some people that prefer joysticks on the right side instead of the standard left side.

Why do all arcade machines have the joystick on the left side and the buttons on the right side?

Since 90% of people are right handers, why wouldn't the joystick (something that needs great control) be on the left side?

Could it be that 90% of the engineers are left handed? :)

LaTeX/TeX is designed to remove the NEED to know "what they're going to
get on the screen". That's the WHOLE POINT of LaTeX - to remove that
burden.

It's time to clear out some ST stuff...

* SM124 monochrome monitor $75

* Discovery Cartridge $75
can convert Macintosh disks <-> Spectre (any Spectre 128/Magic Sac users?);
great floppy disk backup (including PC, Amiga, Mac)

* Supra 20 Meg HD $75
drive is bad, but SCSI controller, case, and power supply are good;
no power cable

* Mark Williams C v.3.0.9 $40
w/ csd C source debugger

* ST monitor -> RCA connector cable $10

* 6' floppy cable $10

Prices do not include shipping.

Email if interested.

Trung

>anybody know?

As far as I know the old versions of OXYD only run with German TOS. When I
first bought my 1040STe, I was in stationed in the Netherlands and the
guy from the shop gave me a Dutch machine 'cause he had a little problem
getting the one with the German TOS. I tried to get OXYD running but it
wouldn't.
So I called Meinolf Schneider, the author of OXYD and SPACOLA, and he
told me that OXYD only runs with German TOS because he didn't want anyone
who doesn't know German to play a game they wouldn't understand.
Again, as far as I know the new OXYD COLOR is suppossed to run in any
language (or at least in English;-).
You can ftp all DONGLEWARE games from a.a.

From: riehm@struppi.medizin.uni-ulm.de
Message-ID: <1992Dec7.102428.21167@wega.rz.uni-ulm.de>
Source record: 213606

Hi ST-Freaks!

A friend of mine (no idea of computing) has got a Mega ST. I got him some
programs from a.a.umich (games stuff). As usual, these games were packed.
But I (<- used to work on UNIX shells where you can type 'uncompress *'
and (arghh!) sometimes on MS-DOS with a simple PKXARC *) don't have any
idea how I can get the arc.ttp (or arc602.ttp) running: Whenever I do
a DoubleClick on the icon, I get a window asking me for parameters,
but I didn't find any which could help. I didn't get any message either,
just a short 'cls' and then the switch back to the Desktop.
Can it be harmful that there's no Harddisk? (Only minimal configuration
with 1 (in words: ONE) floppy disc drive and 0 (in words: NO) HD).

Thanks in advance,

Thomas

Thank you for those encouraging words. Anyone else want to back that up?
Briefly GW comprises of just about everything you'd need to write a game on
the ST. eg. animated sprites, sample playing, colour screen interrupts,
mouse and joystick(4) support, smooth scrolling plus support tools.

>In my experience, folks don't mind paying a fair price for their software as
>long as they feel they get their money's worth and support is there when they
>need it. <mindless, spineless pirates need not apply>

Very true. I often wish Gulam had been supported shareware rather than
freeware. I don't know how I could have lived without it.

> Borland doesn't sell
>thousands of copies of BC++ because it's the only game in town... they sell
>that many because it's a good product which is well packaged and supported.

_ :-)
IMHO Borland C\C++ is a pile of cr*p!
eg. v3.0 takes 39Mb of HD space! I can put most of Sozobon on a 512K RAMdisk.
I use BC+ here at work and if it was me who'd bought it I'd be asking for a
refund. However many peoples mileages may differ so I'll say no more about it.

>IMHO, we want the Game Workbench and are willing to pay for it. Just do it!

Since the folding of Double Click has put the future of Game Workbench in some
doubt I would really appreciate some net feedback about how much you, the net,

would like to have and use it. Both Dave and me have spent the past 3-4 years working on it and I really would not want to see all that work wasted.
I confess that I would get a warm fuzzy feeling knowing that people were using and enjoying GW regardless of how it was made available, be it commercial, shareware or even public domain but considering its sheer size some financial reward seems appropriate. Taking all considerations into account, Dave and myself will probably make a decision soon and I hope that we can make the right one that will appeal to both us and the ST community alike.

>Mach/BSD *is* Unix.
>

Firstly, "hard to get to the "Unix"" means that unless you specifically look for a shell program amongst the applications, you won't see a command line interface at all. The NeXT computers boot straight into NeXTstep, they don't even have all the nice status messages scrolling up the screen as they boot.

Secondly, Mach/BSD is NOT Unix. The name Unix can only describe operating systems derived directly from AT&T UNIX. You tell AT&T (well USL) that Mach/BSD is Unix and you're libal to have a law suit on your hands.

The NeXT's OS is Unix-like, not Unix. And, oh yes, the NeXT does not come with X as standard, you'll have to get that from elsewhere.

DB> library copies are usually specially-made extra-durable (and therefore
DB> more expensive) editions. (But they wouldn't *have* to be!)

Don't concede yet, David! These days libraries don't have the money to buy those so-called library editions. Typically they're getting the same edition you are, and paying less than you do. Vendor discounts run 10-40% off list for books.

OTOH, magazine subscriptions are a whole 'nother story. Institutional subscriptions can be 10 times HIGHER (or more) than personal subscriptions, because the publisher knows that many people will be reading his 'zine, and he doesn't want to lose the money represented by those lost sales.

>Those that complain about how Atari users are still using BASIC (the
>inference being "Grow up, and use a REAL language!") should keep in
>mind the factoid that even in the I*M market, they've been upgrading
>BASIC.

Why is there always this horrible snotty attitude towards BASIC? - I keep thinking that people haven't actually used BASIC since BBC's and ZX81's were around, because the language has become much more powerful since. OK, so direct memory access is much easier with C pointers, and there are some other nice features, but when it boils down to it, if it takes me five hours to write (and DEBUG!) a C program that I could have written in five minutes in BASIC then its pretty obvious which language I will choose.

I should perhaps point out that I have no intention of writing machine-hacking programs such as RAMdisks etc because there are plenty of PD programs already there for me - what I DO write is programs to do with my work, such as data analysis and plotting spectra out, which are very easy to write in BASIC, and would be a complete pain in C.

Apart from anything else, I can write a program in HiSoft BASIC 2 and know (as long as I stay clear of about 2 OS calls) that it will work perfectly well on any ST, with any TOS version. I still have full access to all the "legal" operating system commands, giving me the ability to write perfectly good window/menu/dialog programs, and I do so.

>
>At any rate, it's not COMPLETELY stupid for there to be Atarians still
>working in BASIC. 'Specially when there's a GFA Basic that runs under
>MS Windows.
>

I don't want to start a flamewar about different BASIC's, but please don't ignore the fact that Hisoft BASIC 2 is almost completely cross-compatible with Microsoft QuickBASIC, and I do indeed port programs from my STE at home to the PC I use at work with no hassle at all.

>This should not be misinterpreted to infer that I actually use BASIC
>for anything :-). ANSI C/Perl/Forthmacs all the way...
>

...and there I was thinking that someone had seen the light. When it comes down to it, computer languages are only an intermediate tool for getting the job done, and as long as they're capable of doing that I don't see that it matters WHAT you use. I certainly don't like the implication that my programming is somehow 'inferior' just because I choose to use a different language from someone else.

This is something I and my partner have been attempting to do and are continuing to do. We have seen the light, though, and are currently trying to expand our market to other platforms. If it were only up to my partner we would probably drop the Atari platform. Personally, I still see a future for Atari with the Falcon line. On the other hand, though, I don't see how anyone could feed a family writing software only for the Atari line of micros.

6661. T-Board 64 TOS 2.06 without 1.04 problem.

Newsgroup: comp.sys.atari.st
Date: 1992-12-07 13:28:24 UTC
From: dick@ahwau.ahold.nl
Message-ID: <285@ahx.ahwau.ahold.nl>
Source record: 213584

I have a ST 520+ with 3 Mb installed.
I have soldered on the 68000 a socket for placing the T-BOARD 64.
My old TOS 1.04 (in 6 ROMS) is installed.
Everything works now.
Now I wan't to remove the old TOS 1.04 and start always with TOS 2.06.
Two reasons : 1 reboot less and a startup delay for hard disks.
The manual say's " Just connect the soldering point next to R1 on the T-BOARD
to pin 20 of the first socket which contained one of your original TOS ROMS".
Questions :
The soldering point is that the connection with pin 2 of the GAL?
Pin 20 is that the 'CE' signal of the U2 socket?
If yes, on my system this does not work, a black screen is the result.
Anybody idea's?

You must also disable the bus error signal that mmu generates for the address space $E00000- $EFFFFF.

|>
|> A few questions I have are:
|>
|> 1. Is TOS 2.06 bigger than 192K? If so, does it fill in that extra 32K
|> before IO space.

It is bigger! And is located at $E00000.

|> 3. What is the EPROM type that is used for TOS 2.06:
|> a. TC571000
|> b. TC571001

I have used an 271001 = 271010 this is 32pin DIL with 8bit organization and needs an adapter for the 28pin DIL sockets on the 1040ST board.

>
>They could just go on, day after day, putting themselves on the
>line for us and Atari Corp, and not getting anything back for
>it...

Just another point of view. I *personally* had a really bad experience with Double-Click (after the purchase of my DC Desktop upgrade). They owed me documentation for *over a year* and they knew it. (I have copies of five GEnie mail messages that were ignored by them to prove it.) I finally had to post a *PUBLIC* message on GEnie with copies of the mail before they corrected the problem.

On another note, I have never found any really useful DC utility and use none of them (they had a great tendency to *break* other software). My personal rule was to never, ever buy or use another piece of DC software on my system. I realize that your mileage may vary, but I am pointing out that there may be other forces at work here besides the size of the market. (Note that I still agree with some of what you said about Atari.)

>When Practical Solutions went out of business, all the Atari
>Vultures immediately jumped on them, saying it was their own
>fault they couldn't survive..

This was truly a bummer. Sorry to see them go. In actuality, the size of the market did get them. There was insufficent revenue to sustain their Atari business. Unfortunately, they were undercapitalized in trying to branch out into other (platform) markets. This led to a financial crisis which resulted in their failure. (Good example.)

>When Avante Garde folded, the Vultures accused them of being
>"shady businessmen", not worthy of surviving in our midst..

Here is another example that you should NOT (IMHO) be using. Avant Garde made an excellent software product (PC Ditto). However, they made a *really, really sucky* hardware product (PC Ditto II). The hardware design and production problems drained their resources. Unfortunately, they took the money of a LOT of Atari supportors down the drain with them. (I barely got my money back on a hunch before the board shipped.) Basically, they screwed up themselves. If their market had been any larger when they shipped PCD II, they would have just went out of business faster due to the larger "free" support

effort for a lousy product. Towards the end, they really treated their customers in a rotten manner.

Yes these are cheap, but what about all the software you mention? A
decent wordprocessor for the Intel platform costs a lot of money, while
a good ST wordprocessor is only about $100. And more important you can
run most of these on an of the shelf $500 1040STE , surely that is
cheaper than that 386DX config you describe.

Atari computers just make up a cheaper solution to get started with
some applications just for personal use.

Here in the U.S. ASV is only for developers as far as I know. Nevertheless,
I bet anyone could still purchase it, however:

~ $2500 + $750 to $1000 (the cost of a mono monitor)

i.e. maybe I should have bought an Amiga (but I was a loyal Atari Fan).

Hmmmm, are there really that few Atari users left?????
Not so!
This weekend I read the dutch Atari sales figures. They sold 3200 units, which is the same as the same quarter last year (yes 3200 in just one quarter (the 3rd so not even with Xmas)) and about as much as Apple has sold. Keep in mind that these were just the Personal Computer sales, so 1040Ste Mega STE and TT, not the Lynx.
This is very good when considering that the market in the Netherlands is pretty rotten at the moment. I think this is because Atari does not have that many competitors in the home market, except for those people that are willing to settle for a DOS machine which is not very suited for home use.

Some people have been bandying around the price of a 386-33SX motherboard in the neighborhood of $185. I've seen prices like that in the Computer Shopper, and, generally, such prices are WITHOUT the 386 CPU. And, sometimes, they are WITHOUT the ROM BIOS chip as well.

This allows total do-it-yourselfers to put together a system using parts from a variety of places -- and the totally unaware consumer -would- find themselves having to add 'extras', with no illegality or fraud involved. That's what I meant by the above message ...

I would change that to most if not all games being produced
currently use Soundblaster.

I really don't think it will be hundred of years, check out the
Byte from a few months ago. In it they talk about the use of DSPs in
computers, and how DSPs will be commonplace in a few years/

> Many programs are crippled to allow them to run on 8088 machines (ie. don't
> take advantage of 386 power).

Not as many programs as you think. Any Windows 3.1 or OS/2
application will assume at least a 386.

I don't even own a anysort of Intel machine (unless you count that
8088 motherboard I have in a closet somwhere!) But some people need to wake
up and spell the coffee and realize that Atari really needs to shape up or
ship out.

I have been given binary data files that begin with, among other things,
"LHarc's SFX 1.13L (c) Yoshi, 1989".

These files seem to be self-extracting compressed archives for the IBM PC.

Running lharc (in Unix) on them gives nonsense and corrupt archive info.

Does a "LHarc's SFX 1.13L" for the Atari ST (or source code for
compilation in Unix) exist?

I'm not much of a game player, but I also registered Blox because
I felt that Dave deserves something for his contributions to the
ST community. He has definitely been bitter, but look at his
experiences.

One difference I notice between people I know with pcs and atarians
is that a lot of atari people want and expect software to be free
("has the DC carcass been uploaded to a.a yet?") whereas a lot of
pc people don't expect software to be free so they just steal it :-)

I'm just glad I didn't get my st to build a career on, just to use
at home :-)

In article <70993@cup.portal.com>, Bob_BobR_Retelle@cup.portal.com writes:
>(by the way, are
>you an officer in an Atari user group..? Or two Atari user
>groups at the same time..? Have you ever helped organize Atari
>shows, trying to promote Atari to the general public..? Several
>shows over many years..?) I know you're involved in the
>Atari Archive, which is great, but how about involvement with
>the unwashed masses of helpless Atari owners who have all but
>been abandoned by Atari Corp..?

Bob, you certainly have a short memory (I would guess that a series of postings in this same vein from someone who doesn't agree that Atari computers are dysfunctional in all resepects three months ago might not have made such a big impression at the time...)

Yes. I am an officer in an Atari user group, and have been actively involved with the group since 1986. On average, I get a call from a novice on the order of once a week -- I don't have a contract with CompuServe, so, obviously, I don't get to answer as many novice questions as you.

I've also maintained our user group's DOM library, having added nearly 200 disks to the library in the past two years. I've seen, and tested, most of the PD/freeware/shareware programs available ...

If I weren't already working 60-70 hours per week to earn a living (bad choices in using credit several years ago necessitate a second job...) I'd be working on several programming projects for the Atari ST line -- some of the software I've mentioned in past postings would be reality rather than a challenge for others to get going.

In case you think that I might not be capable of working on programming projects, I should mention that I've worked as an independent programming contractor while putting myself through my Graduate School. True, the platform was the Apple][, //e and IBM, but I think I know enough about the day-to-day trials one goes through to get software out on schedule.

>If we're trying to establish credibility here, how many dozens
>of novice users' questions do you answer in an average week..?

I don't happen to work for a major networking service, Bob. On average, how many novice users' questions do you answer that are not connected with anything more than a local voice call from someone who saw your name listed in the local free computer newspaper?

>How many "I just bought this Atari ST, and don't know anything
>about it.. help me..!" questions do you field during an average
>month..?

Two or three, mostly from folks who've either been given an ST or who got a real good deal on a 520ST at a garage sale. I also get about two or three calls each month from people who want to sell their 520ST with monitor and software ... and I'm very upfront on detailing the current worth of such systems.

>The bottom line is that I believe in helping Atari *owners*..
>nothing will ever make me believe that I have to help Atari
>Corp, or do its job for it..

So? I've never been an advocate of Atari =Corporation=. I just happen to have selected their computer for my home computing needs, and that selection isn't seen as in as dismal a light as you sometimes depict it.

>I'd ask "How about you..?", but your previous postings leave little doubt..

Well, you've obviously read more into my postings than I've actually WRITTEN. I would suggest a realignment of your perceptions.

>> You're a bit wrong here. Best case burstfilling gives a performance of
>> 4 longword access' in 5 cycles! Synchronous (longword) access is done in
>> 2 clock cycles. (Information from MC 68030 User's Manual)
>
>This is assuming that the system design supports a 1-clock (2-state) access
Yes, I wrote BEST CASE. Can't missunderstand that, can you. The F030 (is said
to) have zero waitstate, so best case (i.e. for a 16 bit bus) is relevant.

>mode. I doubt that the TT shared memory would, non-shared memory could but
>not neccessarily at the fastest possible speed.
That's right. I haven't checked the timings of the fast-ram on the TT, but it
does for sure not do zero-waitstate, although it supports burstmode and
sync-mode!

>On the Falcon, you would have trouble supporting the burst accesses, since
>the port width must be 32-bits...

That's right, but syncmode access is fully available (and is used) on the
Falcon, giving a 4 clock-cycles/longword-access to memory! Not to bad, even
if the 68020 in the A1200 'only' uses 3 clock-cycles/longword-access!
Now, take the different clock frequenzies on A1200 and F030, that gives a
lead to the A1200 of aprox. 42ns/longword (250ns - 208ns). Of course overall
performance depends on the timing of the shared memory on both machines
(basic configured machines), but assuming that they have somewhat equal timing
the extra cache and more efficient pipe in the 68030 will make up for most
of the difference between the two. I realize though that the nature of the
code is significant.

So my guess is that the CPU on these machines wil on avarage have the same
performance (on basic configured machines)!
So what it all ads up to is: What machine offers most extras?

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I've got an SM124 mono monitor that is now blank 90% of the time, that is, it may boot up ok, but soon thereafter the display completely disappears as if a screensaver had kicked in. Once I just left the machine on for a while after the screen initally came up blank and it briefly came back on only to disappear after a minute or two.

I know that my screensaver is not the problem and I know I do not have a virus causing this as the problem first surfaced in Mac mode under Spectre GCR and persists even when booting with the hard drive off and no floppy in either drive. Are these the symptoms of the infamous flyback transformer problem with this monitor? Could it be the ST's circuitry and not the monitor (It's a Mega 4)? (The color circuitry does just fine on my color screen).

ST-ZIP usually only plays up with larger files, and it also sometimes works fine, as lon as you use the exact same machine to De-ZIP them.

(e.g. Archive them on your machine, and then a downloader tries to de-zip it on a different model. For some reason this is what gives most trouble!)

Using files of around and below the 40k filesize is usually pretty safe though!

Message-ID: <memo.793406@cix.compulink.co.uk>
Source record: 213644

I can't believe all the rubbish I'm reading on this thread. So DC have folded? So what? They were one little firm who used to write some little utilities and one or two half decent applications. I always found DC stuff to be buggy, often crashing my various systems and in the mainly didn't do much and rarely anything I needed.

Usenet seens to feature mainly US messages where the ST is sure enough pretty much dead in the water. I don't want to surprise you guys but in Europe the ST is still ticking along quite nicely. Sure, it isn't as full of life as it was, but new software and hardware is being constantly released. People are using them for real computing. They way all these postings are sounding, you'd think there were about a thousand STs left in the whole world. I haven't got the figures to hand but in 1991, the ST was the 3rd best selling computer in Germany - ahead of IBM! I can get the figures if anyone is curious.

I know 15 people with STs, most with hard disks, much RAM, laser printers, audio/video digitisers, monitors, midi kit and more. They are still buying stuff, still supporting the ST.

There are several ST magazines in the UK (of varying quality) still going strong - a new one only started a year ago. Currently ST Review is giving away the entire cyber series on it's cover disks. Recently I have got all sorts of commercial peices of software this way. OK, they're the last but one versions but still perfectly usable.

If you want to expand your ST you can buy tower cases, bigger PSUs, add a 68030, add a co-pro, ethernet boards, 24bit graphics boards and much more.

Software? A new version of Calligrapher has just been released, Lattice C is still being developed along with Devpac 3.0 - newly released. In the UK Hisoft are currently writing the new version of Superbase, they've already done a paint package for the Falcon. You can buy a demo disk from them for 5UKP.

Calamus SL and Retouche Pro are as good as most PC/Mac stuff, Retouche is probably better.

There is a vibrant PD community with magazines being full of ads for the various libraries. New stuff is appearing all the time. In volume.

That's enough for now. Just realise that just because DC have gone and the ST isn't big in the US, it doesn't mean it's dead elsewhere. Far from it.

I don't want to start any blasphemous rumours,
But I think that God's got a sick sense of humour - ML Gore

Source record: 213552

I finally got around to downloading another version of Llamatron (I can't remember where I got it from now, it was someplace someone suggested) and it works fine with no hitches on my TT (true, better sound with cache off). Apparently the one I got from a.a. several months ago (which I see is still there) is rather old, before the TT compatibility was added. The one I got explicitly states that it runs on a TT.

I don't want to rag on Wolfenstein 3-D too much, but it is a one trick game (there was a good "Gameplay" column in COMPUTE! four or five years ago on this subject). You can lump it in with all the past games which rode solely on the force of a technological breakthrough. A lot of the first Apple II games which used page flipping (remember Space Eggs?) and the first Mac game with digitized sound (some airplane game) fall into this category.

BTW, it would have been nice to see a little proper credit given, especially since ID went through the trouble to obtain the rights to the Castle Wolfenstein. It's depressing to see the original game and designer so completely ignored.

>lehmann@cs.tamu.edu UPE Honor Society - Vice President

Galaxy is indeed available for the Atari. I have it myself, courtesy of
Mr Andy Gahn at Inmos (thanks Andy). The spec for the system to run it is
2Meg Ram & 4 Meg of HardDisc space. It is possible to run just the designer
on a 1Meg machine if you fiddle with the Galaxy.BOO file.

As for speed, I'm not really impressed (perhaps a TT/FALCON may help?).
The program has never heard of user-friendly.

If this seemed a little harsh & biased, heres why.....
Shameless plug coming up.....

CLA LOGIC SIMULATOR
==========

After a rather prolonged delay, where a few ugly bugs appeared at the last minute,
CLA LOGIC will be posted to atari.archive.umich.edu today.

The file to download is:

CLA_V1R1.LZH

The final spec. for this version 1 release 1 is as follows:

- Full hierarchical structuring of designs.

- A quite nice GUI.

- User definable keyboard shortcuts for all functions.

- Interactive simulation, with the following tools:
- 20 trace logic analyser

- 'Active' probing
- Monitoring bulbs, for those 'quick little checks'
- Variable propogation
- Auto clocking inputs at definable frequencies
- Manually setable inputs
The simulation functions are fully integrated and accessable at any time.

- GDOS output of circuit designs & test results.

- Library module facilities:
- Predefined libraries
- Library module loading.
- Design merge
- Librarian program for maintaining libraries

- Fanout checking (74**, 74HC, 74LS, CMOS, ETC)

This was a summary of some of the nicer features of the program. There are many more features actually in the package.

PLEASE NOTE THAT CLA IS SHAREWARE......

We posted this to a.a.u.e at the start of the summer, and CLA is now available on most FTP sites worldwide which cover atari stuff.
We have a new release almost ready to go now which fixes the problems which we had reported to us with V1R1.

In addition, there is also support for SPICE analog model output (seeing is believing, a new member joined our team & this module REALLY kicks), .GEM metafile production for use in DTP / CAD touchup, new librarian (old on was really naff), new Word Generator (analog + digital !),+ loads more....release January (watch this space), but anyone wanting prelim. specs, or volunteers for Beta testing can Email me (not you Marcel Boom, I've not forgotten you....).

>author can be as money-grubbing as possible."

I repeatedly stated that I was *not* opposed to the existence of
libraries. I am opposed to the creation of equivalent libraries for
software (or the widespread extension of existing libraries to offer
software in the same manner), in the absence of some reliable way to
prevent software copying.

Also, it is, again, not black and white. You can be something between
"charity service" and "money-grubbing." I think that the existence of
libraries moves authors farther towards the "charity service" side of
the continuum, and I don't want to see the same thing happen to
software authors.

No. Using Usenet as an advertising vehicle is inappropriate. I left
the name and number of the company off for that reason. Next time
you're at a bookstore, take a slip of paper with the page numbers on it
with you so you can look them up yourself.

chorus. Ingrate.

>Usenet seens to feature mainly US messages where the ST is sure enough
>pretty much dead in the water.

I don't know, I see a lot of .nl's, .'de's, .uk's and .fr's here.

>I don't want to surprise you guys but in Europe the ST is still
>ticking along quite nicely. Sure, it isn't as full of life as it was,
>but new software and hardware is being constantly released.

Yup. Sorry, but it's only a matter of time. Perhaps we just have a
better understanding of what's going to happen over there because we
know first-hand how bad it can get.

>They way all these postings are sounding, you'd think there were about
>a thousand STs left in the whole world.

Oh no, there are probably a million out there, it's just that not
enough of the owners use them (or pay for software) to support
commercial developers.

>I haven't got the figures to hand but in 1991, the ST was the 3rd best
>selling computer in Germany - ahead of IBM! I can get the figures if
>anyone is curious.

Why don't you do that.

>Currently ST Review is giving away the entire cyber series on it's
>cover disks.

Impressive! I doubt I could have come up with a better example
illustrating how much things have declined. A several hundred dollar
development system, now being given away for free -- that's great! Bet
the developers are *still* writing ST stuff for free, too!

>Recently I have got all sorts of commercial peices of software this way.

This trend obviously can't continue if people stop writing software
because there's no one buying it! Enjoy the gifts while they last.

Source record: 213561

It is quite clear that "book" libraries are different from "software" libraries in fairly fundamental ways.

There has been some discussion on sci.crypt on how cryptographic equipment (considered "munitions" under US export laws) is rather distinct from firearms, even though both are treated similarly by US law. It's clear that there are some similarities, but that the differences are very marked. (For instance, it's a little difficult to pistol-whip someone with a 83C852 microcontroller chip :-)).

The differences between book/software libraries are equally marked. A "library" where you can "borrow" computer software would, due to the nature of digital technology, allow the making of PERFECT copies with relative ease, and at minimal cost. Copying books is both more expensive, and relatively less successful. A sheaf of photocopies isn't as nice as a hardbound book.

Unless a way is found to make a "software library" commercially viable, it's not going to happen. (It took a lot of time and effort to get the "book" variety going, I should note!)

It is currently quite profitable to run a "PD Software Library," but such things tend towards second-rate software that people ARE willing to give away for free.

Of course, some of that "second-rate" software DOES do what it's supposed to, and may even be better than some of the software that people pay big bucks for. But that's certainly not always true.

|> Modem Internal or external External only
|>

Yes, the power and variety of gadgets one can plug into a PC is amazing.
But my point was that, since the PC became mainstream, the percentage of the
market that is willing to 'pop the top' and add 24-bit video is very small.
Why would someone with a PC-XT/640k/20MB monochrome system want to upgrade
components when a new 386/4Mb/100Mb is so cheap? In my experience, they don't.
They just go out and buy a whole new computer.

I don't need every new video gadget or processor. I tend to skip a generation
or two, then jump to the new stuff. If you HAVE to have the latest processor,
or video card, or whatever, then closed machines from a low-end company are
not what you want.

Sure, it would be nice to be able to pop in a new processor card, but I don't
think it is really necessary, as long as you can always buy a new, much better
machine at a decent price. The TT and the MegaSTE were several years too late
to keep Atari from pissing away their early advantages.

And a computer like the Falcon030 is aimed at the market that wouldn't be able
to tell if they had 8-bit/16-bit/EISA/Microchannel bus to save their lives.

|> An open architecture costs nominally more (if that) and encourages
|> third party add-ons that make a machine more useful. It extends the
|> useful lifetime of the machine. It makes good techinical sense and is
|> smart business.

I recently have noticed that 'local bus' video is becoming popular on PCs.
Aren't these then closed systems? Shouldn't you tell these guys that they
are making Atari-scale mistakes? :-)

|> >Advantage: Falcon030.
|>
|> For 6 months? A year? In the end, Atari loses again. Much as I am a
|> die-hard Motorola sympathizer, I just can't get excited about the
|> Falcon. It's basically just an ST made to 1991 pop specs. Which puts
|> it in the same boat as the ST in 5 years (probably much sooner given
|> Atari's continuing power dive into the red).

Five years is a looooooong time in this business. Remember, five years ago,
VGA was brand new from IBM. (I think it was 1987 or so...)

There is one *BIG* advantage to the consumer from open systems like the PC.
They can be easily cloned, which drives the price way, way down.

Would PC's be cheap and powerful if only IBM/Intel made them? Nope.
They wouldn't be all over the place, either.

Oh well.

>conversion of GIF (Graphics Interchange Format) pictures (Any config, CGA,
>VGA etc. 320*200, 640*480 etc.) Into RAW format.
..
>Has anyone registered their 'Photo-Chrome' and gotten the GIF conversion
>function? Any good?

I don't think Douglas Little has added that function yet - he was wrestling with the Compuserve GIF documents last I heard. They don't give the LZW compression algorithm which makes writing a GIF converter a bit difficult. I think Falcon stuff is taking up a lot of his time too.

When I registered Photochrome he sent me a program he got hold of called GIF2RAW (which isn't as good as the one on ST Format, but was a lot better than nothing at the time). I suppose he'd send it to anybody who asked about GIF conversions when they registered. The latest version of Photochrome also has at least one bug-fix: small RAW files now work.

> not like I don't know all about the machine and what developers got
> with it, OK?

Excuse me, but I have to take exception to that statement, particularly since I wrote the voice mail program that we were showing on the Falcon at Comdex. Real-time voice compression and FFT analysis of telephone tones seems pretty substantive to me. I personally am very pleased to see that a single DSP is present and fully supported by the operating system, because I have a lot more applications in the pipeline that are going to rely on it being there. This sort of development effort simply wouldn't be worth considering if I had to think about varying models of DSP cards being present or absent. As it is, I know exactly how to deal with it in both the single-tasking and multitasking cases, so I know my software is going to work, period.

>some applications just for personal use.

You're absolutely right.. that's a 100% correct statement..

The problem is that you know that, and I know that, but Joe Blow in the street who's looking for a computer to do word processing on has never even HEARD of Atari computers, nor are there any dealers he can visit to even take a look at one.

Why would he trust his $100 to a wordprocessor he's never heard of, and which he can't ask anyone around him about since they've never heard of it either?

Why not pay for WordPerfect 5.1, since he knows what it is, and knows he can get support for it without having to make calls to the UK for help..?

In fact, a lot of PCs are now bundled with useful (and known) software like MicroSoft Works, or even WordPerfect, so there might not even be any extra expense involved at all.

(And before anyone gets hyperventilated, I'm talking about giving a legitimate package with the computer, NOT pirating it onto the hard drive.)

Unless Atari can achieve some kind of public awareness of their products, they'll have to have at least SOME "big names" to attract potential buyers, and to give them some confidence in the line.

I wonder who they can get though.. they've alienated WordPerfect, Borland just laughed at them, and MicroSoft won't talk to them any more... (and before we hear all the "Who needs Boringland, or MacroSloth, good riddance" comments.. that's a cute attitude, but it's not helping Atari...)

You would lose that bet in a flash, since the Falcon DSP runs at 32 MHz and
also with 3x16kW of 0 wait state memory, as well as 8-channel audio I/O.

However, I *would* wager that the Falcon's DSP will beat the pants off any
PC DSP board you could buy in the $100-$2500 price range.

>variety of places -- and the totally unaware consumer -would- find themselve
>having to add 'extras', with no illegality or fraud involved. That's what I
>meant by the above message ...

Umm.. how do you KNOW those prices are for motherboards WITHOUT the CPU
or ROM BIOS if the ads aren't marked as such..? (Or do you call up every
advertiser in Computer Shopper and ask them..? The term "generally" seems
to imply that you have fairly comprehensive knowledge of where you speak)

And.. if the ads ARE marked as being without CPU or BIOS, then why in the
world would a consumer, unaware or not, be surprised when the board
doesn't have a CPU or BIOS..?

In my experience, the boards that are supplied without chips are in the
tiny minority.

However.. to put your mind at rest.. go to a Computer Swap Show and
look at motherboards.. pick one up and actually touch the CPU chip
and feel the ROM BIOS to make sure they're real.. then look at the
$185 pricetag.. I've done just that..

(Incidentally, that $185 is for a '386DX 33Mhz with 64K cache.. you can
actually get '386SX motherboards (WITH the CPU and BIOS) for $115)

Hey Dave - could you include a telephone number next time?

We think you're lying to us all, and we'd like to check out your
prices..

By the way, turns out *I* lied in my last message.. the '386/33Mhz/64K
board is only $175, and it's now a 40 Mhz board..

Also, the '386SX/16Mhz board for $115 is now a 25Mhz board for $94...

(Anyone want some numbers to see if I'm lying, or if these come with
CPU and BIOS..? How about US Turbo Systems (818) 579-2405
Or ZORA Computer (800) 878-5838, or GWC Computers (313) 565-0563)

Bandwidth limitations. At that resolution the video would use up about 90% of the available memory bandwidth, leaving the CPU to run at an effective speed of 2 MHz. I'm a little surprised that 640x240x16 was unavailable though, since they could have used a single-line buffer to bring the bandwidth requirements down to the same as 320x480x16.
>

Nope, I know it runs perfectly well on the 1224. Looks pretty nice on my 27" Sony XBR TV, too. I must say, playing Dungeon Master while sitting a mere two feet from a large screen is quite an interesting experience, especially when piping the audio thru a 250 watt stereo/surround amp...

Indeed... and it takes a master practitioner of the craft to recognize
when it's being done to you..

However, since you brought it up.. (ah.. don't you love being
manipulated into that position..? :)

The issue turns out not to be a "non-issue" at all..

In this particular message, and in most of the others about the Falcon,
the common factor that ties them all together is the use of the FUTURE
tense.. (thus the "grammar alert", and the bait, which you swallowed)

"...software which WILL let you use the DSP to wash your underwear.."

"...matrix boxes which WILL let you listen to 8 different CDs at once.."

...Falcon WHEN they arrive at your local Atari dealer/gas station/7-11.."

Just wanted to poke that particular pointy stick in your eye again..
Thanks for the help, David..!

>The problem is, there is only one DSP port. You can't have all of
>them hooked up at once, can you?

It all depends on who you buy from. The telephone interface box we designed for our voice-mail system is a full-featured telephone controller. Once the audio gets from it to the DSP you can do whatever you want with it - crunch it with FAX software, data-modem software, or voice-mail. You won't even need one of those silly Fax/phone switches (that only sometimes work right); you can plug a single phone line into our box and we'll provide software that automatically detects the type of incoming call. (Atari wanted us to provide the entire integrated system, i.e., one software package that does fax, voice and data, but I must admit, it is no fun to decode v.32 data encoding on a DSP. However, there are already commercial sources of code for this purpose, so we may wind up licensing that bit from someone else.)

Now - if you want to do something else with the DSP that is not telephone related, I think there could be a conflict. The current phone-interface box just needs one audio channel to operate; if you also want to plug something else in (like the AD/64x 8 channel I/O box) you could just plug our box into one of the 8 audio ports. Haven't thought much further than that.

Actually, every port of KA9Q for the ST that I've seen (including the two
I did myself) has always supported SLIP on both the RS232 and the MIDI ports.
I in fact have run a network of 4 STs (Mega 4, 1040 STe, and 2 Falcons) thru
the MIDI with one ST routing over the modem back to a Sun workstation at JPL.
This is even better than using a PC for the routing since the ST to ST
communication occurs at 31.75 kbaud, instead of 19.2k.

Unfortunately, you can only get data in and out of the DSP at 1MB/sec. That
means that any such real-time compressor will still run slower than a fast
SCSI-2 drive.

However, it still seems like a good idea in the short term since it *will*
give you more storage space, and few people are likely to own faster than
1MB/sec hard drives in the next 3 years. I can't say any more on this subject.

You read right! I have an Atari 1040ST for sale. It comes with:

* Atari Mouse
* Atari SM124 Monochrome Monitor
* Magic Sac + and Translator One (Mac 512 hardware emulator with some Mac
software)
* PC-Ditto - last US software version (IBM emulator)
* Final Cut (16 Track Midi Sequencer for the Atari ST)

I have been using it as a terminal emulator lately and feel bad that it's
gathering dust... I am asking $350 Canadian for the entire package.
I can break it up, but prefer not to. (Already had offers for the monitor
since my last posting, but turned them down as I want to sell the thing as
one whole package). If interested, leave me email!

You can now change into the Lynx and Dc directories. We were operating
under a messy filesystem arrangement, which I fixed today. Thanks
to all who pointed it out.

The New directory is supposed to be that way, to keep people like you from
getting files before we can take a look at them and be certain
they're not copyright material or some other form of illegal software, etc.

Anybody have an SM124 mono monitor for sale for not too much? I've got
a 1040 doing second computer duty, and the mono monitor has gone blank.
A cursory peek shows no glow in the picture tube, but the fuses look OK ...
I suspect the cost of labor and parts would exceed a used monitor.

So ... E-mail offers, used computer dealer phone's or ideas on monitors ...
I'd be grateful.

R.

Seems to happen every year... though it has died down
as ATARI and COMMODORE dies down,...

Just insecurity....

ATARI HAS NOT gotten THEIR act together at all.
Seems as if management has a lot to do with it...
... as if the people hired their just want to make a quick
buck...
HAVE you noticed that when people hired by ATARI are always
enthused... yet when they retire (quit), they say that
ATARI never had it together...
probably communication break down somewhere.
I'll bet they knew in the back of their minds that ATARI
would not succeed AS WELL... (or probably needed a job).

I've been an ST user for over 7 years and ... this
is it for me....

I'll see if anybody wants my beat up MSTE.

>machine on for a while after the screen initally came up blank and it
>briefly came back on only to disappear after a minute or two.

For all you people that have problems with your atari SM124 monochrome
monitors; here are some notoriusly unreliable components that you may wish to
replace. C717: this is a capacitor near the large twisted heat sink on the
right of the chassis with the back connectors facing you. This capacitor, so
near the heat sink, heats up. Once the electrolyte begins to leak the cap
deteriorats. This may end in an actual explosion (it did with mine). Simply
replace the cap with another at least 200V (I think its 4.7uF). This cap is
underated in the stock monitor and WILL go at some point.
Other caps are C716 and C715. These will cause the screen to quickly
get smaller and smaller and dimmer and dimmer (as the cap leaks). These
suffer from heat strain. There is no way to protect them except to stick
heat sinks on them.
I use my SM124 every day and have been for 7 years! These three caps
are the only things that have caused my 124 problems. There may be other
problems. Mostly it is a cap problem because of heat stress. Those 124 really
heat up and there aren't really enough heat vent on the monitor case. You can
check for a failed cap by opening up the monitor and examining the circuit
board. Look for caps that have brown goo leaking from them. These should be
replaced.

From: lombardo@cwis.unomaha.edu
Message-ID: <lombardo.723790583@cwis>
Source record: 213587

I have hooked my sr16 drum machine up to the st via midi and I am in need of a program that will accept midi signals from the drum machine and play samples in response. My ST Replay 4 program does this, but has a limit of 10 samples (that kinda sucks) and they all must be played at the same speed. I would like to know if there are any pd programs that will allow for more samples to be triggered and at different speeds. How hard would it be to write such a program? Also, is it possible to allow more than one sample to be triggered at a time (like with a tracker?) I need the digitized sound routed through my replay cartridge for better quality, too.

Does replay eight have more options on midi sets? any suggestions?

STOS v2.6 is (from memory) the latest version, and works with all TOS
versions up to and including v1.62

Compiler v2.7 is (as far as I know) the latest version - why it is
2.7 and not 2.6, I don't know, but it's the version I have!!

Somewhere around was a program to upgrade STOS and the Compiler to
version/s 2.6 - If I can't find it on FTP, I'll see if I can find
it locally and upload it to atari archive!!

The Bug is well known, it will corrupt Archives, even the Author
has found this, DON'T USE IT to ARCHIVE FILES...!!!

You will get a CRC error when extracting files bigger than 40k..

There is claim that a New Version is on its way...!!!

Roger..... sheppard_r@kosmos.wcc.govt.nz

6740. Re: ATARI GRAPHICS CARDS

Newsgroup: comp.sys.atari.st
Date: 1992-12-08 08:04:14 UTC
From: lahtinen@gideon.fmi.fi
Message-ID: <lahtinen.723801854@gideon>
Source record: 213599

I noticed that there is some interest about graphics cards for Atari,
I would like to share a little information on my Matrix C32 card.

I have been using it for some time and it has been very nice. It
is quite easy to configure with a GEM based tool, and you can set
the resolution to what you monitor can handle (up to about 800x600
as the card can handle only 32 MHz). My (old) multisync could only
handle about 750x525 with either b/w or 256 colors. Actually
I had also 800x600 resolution but the screen refress was about 40 Hz
and it was not easy for the eyes...

By the way if anybody has an empty Mega ST bus, I would like to offer
my card for it. I just started to use SST and the C32 does not like it,
so I must sell it (and I surely miss it). My card is 512KB and has
also the math coprocessor included, and the drivers are the latest
ones. The price of the new card (w/o 68881) is about $600, but
I would be happy with $300. So if anyone is interested, please
email me!

6741. DSPs

Newsgroup: comp.sys.atari.st
Date: 1992-12-08 08:31:15 UTC
From: papresco@cantor.math.uwaterloo.ca
Message-ID: <ByxMC4.Grn@undergrad.math.waterloo.edu>
Source record: 213501

With all this talk about DSPs on the motherboard, I have a few
questions:

1.Can a DSP do anything that a fax/modem/soundcard combination can't?
2.Does a DSP need the high-bandwith motherboard bus?
3.What Falcon applications exist that take advantage of the DSP?
4.Can existing applications use it for anything?
5.Can it be used for anything outside of multimedia? i.e. speeding up
number crunching?

6742. Problems with Ghostscript

Take a look to atari.archive.umich.edu. There you will find the new
FONTGDOS (almost compatible to the normal GDOS). All of the new
drivers can be configured - so just select 180x180 dpi in the
CPX-module that comes with FONTGDOS.

If you want to stick to the old GDOS try the NB15.SYS driver for
example. But don't mix up parts from GDOS and FONTGDOS.

6748. Virus killer

Newsgroup: comp.sys.atari.st
Date: 1992-12-08 10:46:07 UTC
From: cgra@btma74.nohost.nodomain
Message-ID: <1347@se.alcbel.be>
Source record: 213550

Sorry to put what looks like advertising in here, but I've lost the email address of the guy who originally asked me about the anti-virus program Sagrotan.

The author's address is: Henrik Alt, Kirgelweg 25, 7160 Gaildorf, Germany. No email address on the "info" box, but he must be on maus somewhere. The program is shareware 9registration ca. DM30). It is _very_ thorough, but
- takes a while to run on a harddisc (checks every program file!)
- gets confused by two programs with the same name, even in different folders (like my PIPE.TTP's for Gemini and MiNT): thinks one is a corrupt version of the other
- refuses to accept some copy-protected programs, or programs like MiNT which use nonstandard symbols, as valid.

The last two mean I can' _quite_ just walk off, have a cup of coffee, and come back to see "no virus found" - I have to nudge him along once or twice.

Mind you my version is quite old. Maybe some of these things have been fixed (particularly wrt MiNT).

Bye, sorry about the bandwidth

Chris cgra.se.alcbel.se

<IO92257@MAINE.MAINE.EDU> writes:
> It does! :)

Pull your head out of your arse. Have you seen a falcon "in the
silicon and plastic"? I have, but I didn't get to try it out myself.

What do I think? It has good speed. Disks opened and menus
activated very quickly. I'd compare it to a 386 PC box for the speed
of it's responce to the user. I saw a slide show running on one falcon
with an Atari monitor (I forget the model). The color and resolution
were good. I wouldn't complain if my current computer had a display
capability equal to the falcon. The DSP certainly has a lot of
potential, but it wasn't demo'd that well when I saw the falcon.

What didn't I like about the falcon. My biggest gripe is
the style of the GUI. *UGLY*. Some people may think I'm picking at
trivialities here. Those people probably don't spend as much time
per day looking at GUI's as I do. I can say for fact that I would
find the falcon GUI tireing if I had to look at it for very long (or
very often). The Workbench on AmigaDos 1.2 is better to look at than
the falcon GUI. I should add that any GUI customising features that
might be available were not demonstrated when I saw the falcon.

Now for the all important, "Would I buy one?". No, for several
reasons. 1. I have owned an Amiga for over 4 years. In that time I
have developed a level of knowledge and collection of software (none
pirated) which would take me a long time to rebuild if I switched to
a falcon. I would be starting from scratch again, which is something
I don't want to do.

2. The falcon is in a console style casing. I already have
a console style Amiga. I intend to buy a computer with *internal*
expansion slots as my next machine.

3. Support. The falcon may well become the most successful
computer Atari has released since the 520ST, but here in Australia,
I don't expect the market of software and hardware for the falcon
to match the market for the Amiga (which isn't overly large).

About the SCSI-2 port, some pinouts I looked at showed it to be an 8-bit interface, but I always thought SCSI-2 was a 16-bit interface - is the only difference between SCSI-1 and 2 the driver software? I know you can get 16-bit SCSI-1 interfaces with some computers. Is it the case that SCSI can use 8 or 16 bits (or more?), and if so how do you tell devices connected to the bus it's size. Finally, what is the maximum speed of the SCSI-2 port on the Falcon?

>
>Stick to LZH or ZIP or ARJ, lets ban ZOO...???

Just because you are prejudiced, there's no need to slag off a perfectly
good program with lies.

>No way can ZOO generate Folders on Demand..??

Since when? I do it all the time. Try reading the manual.

>Tell me chaps can ZOO do this. a:\archive.zoo d:\extract\
>Can it generate the d:\extract\ Folder..??

Well I can guess the meaning of the first line from the second. The answer is
no, but then I don't want it to. zoo is designed to run from the command
line and so mkdir; cd; are perfectly accepable substitutes.

>Until you have used LZH201L, you will never know..!!!!

I have & I'll stick with zoo. There are 2 reasons. 1) I prefer to control an
application and not have it dictate to me what it is going to do. 2) much of
my work is with scripts and only zoo will work in these.

Are these the only arguements you can come up with against zoo. Just understand
that people have different perspectives and need. LZH suits you, fine.
Just don't try to impose that view on others.

GET A LIFE

In <71194@cup.portal.com> Bob_BobR_Retelle@cup.portal.com writes:

>Unless Atari can achieve some kind of public awareness of their products,
>they'll have to have at least SOME "big names" to attract potential
>buyers, and to give them some confidence in the line.

More public awareness of Atari stuff would indeed be a good
thing. However, I don't think this goal has much to do with
getting "big name software" on the Atari. It seems to me that the
"big name" software houses will always tend to emphasize
development of the PC versions of their stuff, given the size of
the PC market. So why should anyone buy an Atari to run "big
name" stuff, knowing that the PC versions will always be a step
ahead of the Atari versions?
What is really needed is getting people informed about the real
advantages Atari computers have. A friend gave me a copy of the
"Application Systems News", where they give information about
some of their products. On the first page, they have a neat
analysis of the TT vs PC issue, and in their Pure Pascal section,
they give some results about how Pure Pascal on a TT outperforms
Borland Turbo Pascal 6.0 on a 33 MHz 486 PC. This is the kind of
information that really needs to be spread widely.

>I wonder who they can get though.. they've alienated WordPerfect,
>Borland just laughed at them, and MicroSoft won't talk to them any
>more... (and before we hear all the "Who needs Boringland, or
>MacroSloth, good riddance" comments.. that's a cute attitude, but
>it's not helping Atari...)

Regarding WordPerfect, it seems to me that the failure of WP for
Atari is mostly the fault of WP Corp. I've seen the ST version,
it is undoubtedly utter crap. I don't understand at all how the
WP forlks could ever dream that a slow, sluggish, user-unfriendly
word processor like their Atari version could become any kind of
success in the Atari world, where people are used to high
standards since long.
Regarding Borland, I don't quite see what made them quit the ST
market, the Pure stuff seems to sell ok, and they could have made
the sale had they not foolishly decided to discontinue their ST
line of products.
Of course, all this doesn't help Atari, but it may help to see
that Atari is not the only one who keeps goofing things up. At
least, I personally fail to see in which respect the two
companies mentioned above have acted in a more sensible way than
Atari did.

...lousy marketing...

: Anyway, the FALCON will be better than the Amiga 1200 which is called
: a 'Game Machine' !!!! Poor Amiga-users.This is not going to be easy
: for them !!!!

What? That the A1200 is for sale and the Falcon isn't? Come on, you should know better. Die-hard Amiga users are never going to buy a Falcon, just as you'll never buy the 1200.

It has been discussed before (especially in comp.sys.amiga.advocacy), but to say that the Falcon is better than the 1200... both have their advantages (030 - DSP - SCSI II - pretty cheap vs. 020 - 24 bit video - 2MB - PCMCIA - really cheap) as well as their disadvantages (24/16 bit bus vs. no SCSI).

So, if there's really going to be the big fight between the A1200 and the Falcon/030, it's for those unawarry customers who don't know anything about computers and want to buy a toy for their kids. In that case, the 1200 has the advantage of being cheaper AND available this Christmas.

Peter.

6761. HELP! TOS Error 35! Augggh!

Newsgroup: comp.sys.atari.st
Date: 1992-12-08 14:37:00 UTC
From: dud@cbnewsf.cb.att.com
Message-ID: <1992Dec8.143700.14113@cbfsb.cb.att.com>
Source record: 213513

Help!
Ever since I souped up my 520ST to have 4Meg of memory, I get TOS
Error 35 for many programs that used to run just fine. On the other
hand, many programs still run just fine, so I don't believe that there
is a hardware problem.

Here is an abbreviated list of:
What works What doesn't
Llamatron (color) Runner (lode runner clone) (mono)
Drachen (mono) Monopool (mono)
Tanks (color) Monolife (mono)
Jumble (mono)

I have a funny feeling that this problem is due to the load address,
or the amount of free ram, or something like that. Surely someone
has found a fix for this problem? How about a program that consumes memory,
like the EATMEM TSR available on MSDOS machines?

Thanks in advance,

>and #2 a 19" mono monitor.

You could get one from the US via mail order, but
a) The power supply in the US version is different.
b) The modulator in the US version is different.
b) It costs a fortune to send something across the Atlantic at any
speed.
c) The US is not in the EC so you will have to pay VAT on top.
d) The Falcon won't be available in the US for several months after
the UK.

Alternatively, you could walk over the border into Northern Ireland and get
one in the nearest computer store once it is released in the UK. Mail
order prices are #449 for 1Mb
#799 for 4Mb w/60Mb hard drive (this one from memory).
RRP is #499 for 1Mb, I don't know about other versions.
Note you will need a TV with UHF (not that I have ever seen one that only
does VHF in Ireland).
14 Mb and 4Mb without hard drive won't be available here until after
Christmas (I am 99% sure).
You can't get 12" mono monitors any more, the latest version is the SM146
which is supposed to be 14" and costs about #129 mail order. Falcon030s will
need a graphics card to use 19" mono monitors (and I don't think there is a
suitable card available yet). Your best bet is to use a VGA colour monitor.

:ps: perhaps this will get'm

Well, "Yes" for the moment, anyway.

The word from Mike Goodman (proprietor of Goodman Enterprises PDL which is
the Official STOS Shareware Service) is that STOS author Francios Lionet is
waiting for the Falcon to settle in before a new version of STOS comes out.

Last versions were V2.6 for the interpreter (for TOS1.62) and V2.7 for the
compiler (which gave AMOS tracker compatibility).

>You must also disable the bus error signal that mmu generates for the address
>space $E00000- $EFFFFF.
....
> Bernhard Anderer

The bus error signal wont be generated because I will supply DTACK. I have
an external bus that I generated which I put a TMS320C30 at 0x400000
to 0xBFFFFF that generates DTACK. I'll just do the same for 0xE00000 space.

All you need to do is short your own DTACK signal to the 68K signal through
an open collector gate and the MMU will notice. This prevents the MMU from
generating the bus time out signal known as the killer bus error. Two or so
years ago I convinced myself that the DTACK bus running thought the ST was
indeed an open collector (open drain) bus. This allows you to do that wire
OR thing. I've had my external bus running for a couple years now using this
technique with no problems at all. The waves look fine on a scope.

Later

6769. >>> FOR SALE: Hardware/Software

Newsgroup: comp.sys.atari.st
Date: 1992-12-08 17:17:42 UTC
From: blv@col.hp.com
Message-ID: <1g2lbmINN7l2@hp-col.col.hp.com>
Source record: 213520

I have the following Atari ST hardware and software for sale:

Color Monitor $125
This is the original color monitor for the
ST. I don't remember the number--maybe 1224.
Perfect condition. Used to play games. I used
mono for everything else.

STonehenge 2Mb external RAM disk $75
External RAM disk that plugs into the DMA port. Has
its own power supply so you can turn off the computer
and preserve the contents of the RAM disk.

Page Stream 2.0 $75
Desktop publishing for the ST. Over 200 PD fonts
included. Most have sample page printouts. Also
included FontVerter--a font converter. Hard disk
highly recommended to run this software.

Turbo ST $15
Software graphics accelerator.

VIP $20
Lotus 123 spreadsheet clone. GEM based.

SimCity $20
City simulation by Maxis.

GunShip $20
Helicopter simulation. Fly missions, etc.

Police Quest I $20
Role playing game.

Mean 18 $20
Golf game by Accolade.

Time Bandits $15
Arcade puzzle game. A classic. Supports 2 players.

All prices include shipping in the US. If prices are too high--make
me an offer. However, the first response at the listed price gets it.
Quantity discounts available.

Send email to Bob Vixie at blv@col.hp.com

6773. Re: HELP! TOS Error 35! Augggh!

Newsgroup: comp.sys.atari.st
Date: 1992-12-08 18:52:09 UTC
From: wells_s@kosmos.wcc.govt.nz
Message-ID: <1g2qsplNNks2@golem.wcc.govt.nz>
Source record: 213526

TOS error #35 usually occurrs on a corrupt, or non-executable file's
execution. Possibly due to an error on the disk which has since repaired
(otherwise you would be asked to 'cancel or retry'.)

It can occur at other times, but basically it's when the ST tries to
run some impossible instruction. (e.g. clear printer, when it's supposed
to be saying clear screen) not a very good example - but an example!! 8-)

Try downloading the problem files again, if it still plays up - there's
a problem somewhere!

In article <ByxMC4.Grn@undergrad.math.waterloo.edu> papresco@cantor.math.uwaterloo.ca (Paul Prescod) writes:
>With all this talk about DSPs on the motherboard, I have a few
>questions:
>
>1.Can a DSP do anything that a fax/modem/soundcard combination can't?

Yes, it can adapt. When new compression and data modulation schemes are developed you generally have to get a new modem to use them. With a Digital Signal Processor you just update the software. DSP based modems are more flexible (and more expensive) than modems using the standard Rockwell chipset for this reason.

>2.Does a DSP need the high-bandwith motherboard bus?

It depends what you're trying to do.

>3.What Falcon applications exist that take advantage of the DSP?

Dunno. Kind of a moot point until we can get our hands on the hardware. I've heard reports of development of modem and hard disk recording software.

>4.Can existing applications use it for anything?

Not current versions. Software must be written specifically to call the DSP.

>5.Can it be used for anything outside of multimedia? i.e. speeding up
>number crunching?

DSP's are designed to perform fast multiply/accumulates, operand fetches, program control and I/O. Any application that needs lots of integers slammed around quickly can make use of it. It's also great for applications requiring high precision operations: the DSP56001 uses 56-bit accumulators. It is not a floating point chip, so don't expect it to act like a math coprocessor.

Here's an abbreviated list of applications listed in Motorola's DSP56001 user's manual:

Telecommunications (tone generation, voice mail, vocoders)
Data Communications (Modems, Fax)
Image Processing (Pattern recognition, image restoration)
Graphics (3-D Rendering, Desktop Publishing, Animation)
Instrumentation (Spectral Analysis, Waveform Generation)
Speech Processing (Speech Synthesizer/Recognizer)
Audio Signal Processing (Music Synthesis/Processing)

High-Speed Control (Laser-Printer Servo, Motor Controller)
Vibration Analysis (Electric Motors, Turbines)
Digital Video (Digital Television, High-Resolution Monitors)

A DSP is not like a hardware accellerator. You can't just drop one in your system and expect everything to go faster. In fact, none of your existing applications will go any faster due to the DSP. What the DSP does offer is the potential to open up the Atari to a wealth of new applications and markets. It seems like it was a good decision to include it: it doesn't add a great deal of cost to the machine, and it does offer a compelling reason for developers and consumers to choose it over other similarly priced machines.

When someone argues that they can install a DSP board in their Bananna 1200 computer, remember what kind of a jump Atari got in the MIDI market due to built in MIDI ports, even though MIDI cards were available for the Bananna 1000 at the same time. I worked for a company writing software for another manufacturer's DSP (TMS320C30) card that installed in a PC. We had all kinds of compatibility problems between that card and many PC clones. What a nightmare. I speak from experience when I say that DSP software houses would much rather design for a computer with an integrated DSP than a plug in card.

So while having the DSP56001 in the Falcon030 may not change any of the software applications you use day to day, it does increase the Falcon's chances for survival by opening up new applications markets.

>use are Falcons to drive the NSA nuts.

This brings up an interesting point about the DSP - it should be possible
to modify a lot of existing programs to run faster or better than they
currently do on other Atari machines. Anything that does lots of
number-crunching should be able to take advantage of a well-written DSP
algorithm. For example, fractal programs, FFT calculations, vector/3D
viewing calculations, etc.
On the other hand, I don't know if compression/decompression is something
that can be written in a DSP program. I don't know what most compression
programs use nowadays, but it seems to me that something like Lempel-Ziv
encoding is not suited for use on the DSP. Of course I could be wrong here,
I don't know too much about the internal workings of ARC or ZOO or anything.
So, maybe someone who does know this could tell us whether this could be
done effectively with a DSP algorithm. Anyone?

First of all, thanks to everyone who bought software when
I posted previously. The following list is everything I
have left, and I'm selling them for --> $5 each <-- !

As before, I will pay the shipping; but I will ask that
you order at least 2 titles. And I still have some PD
disks and Atari magazines (with disks) that I will include
with each order, as long as they last. All programs have
their original boxes and docs; and if you have any questions
about any of the listed programs, email me and I'll try to
amswer them.

Gary Anderson
ganderso@unlinfo.unl.edu

3D POOL (microplay) very realistic 3D-modelled pool game
A DAY AT THE RACES (team) detailed horseracing sim
ACES OF THE GREAT WAR (mindscape) WWI aerial combat
AMERICA COOKS AMERICAN (cda) recipe file
ANALYZE (mss) spreadsheets/graphs
ARCHIPELAGOES (fanfare) "planetary restoration" - unique
ARKANOID (taito) multi-level breakout game
BORODINO (turcan) Napoleon's battle of 1812
BORROWED TIME (activision) 1-man military missions
CARRIER COMMAND (rainbird) air/ground/naval combat
FINAL ASSAULT (epyx) mountain climbing sim
FLIGHT SIMULATOR II (sublogic) flight sim
GAMEMAKER'S MANUAL (sigma press) game creation instruction on STOS Basic
GFA ARTIST (michtron) art/animation program
GFA BASIC (michtron) programming language
GONE FISH'N (interstel) bass fishing sim
GUNSHIP (microprose) helicopter combat (STf only)
HARLEY-DAVIDSON (mindscape) motorcycle sim
HEATWAVE (accolade) offshore speedboat racing
HUNTER (activision) 1-man commando missions
LEADER BOARD (access) golf sim (+ extra courses)
LOMBARD RALLY (mandarin) European rally racing
MAJOR MOTION (michtron) arcade combat-driving
MLB BASEBALL II (mlb) stat-driven baseball sim
MLB MANAGER'S DISK (microleague) trade/draft/rosters
NAM (domark) Vietnam - strategic level
NAPOLEON I (internecine) Napoleonic campaigns 1805-1814
QUESTRON II (ssi) fantasy adventure game

Howard, you seem to know what you're talking about here, perhaps you can enlighten us as to the whole Falcon monitor thing. :)

1) If the Falcon's hardware is the reason why you can't get 640x480x16bpp on a VGA monitor, then how can it do 768x480x16bpp on a SC1224/TV? Does it have to do more stuff to output to a VGA monitor or something?
2) Will a VGA (standard, like the $240 kind) monitor do overscan? Will a multisync?
3) Is there any monitor out there besides the SC1224/SC1436/TV which can do 80 column 65536 color mode without interlace?

Any info you can give will be very much appreciated.

>so we may wind up licensing that bit from someone else.)

One thing that would be pretty interesting in this vein would be a device which was a modem and a telephone. Since we all know the Falcon is well able to receive, process, and transmit digitized sound in real time, wouldn't it be possible to make a "telephone" for it. So, you plug in your microphone (maybe a headset), then plug your modem/phone device into the DSP and the audio input/output, then via a program you can use your computer as a telephone. Brings a whole new concept into the "dial" function in your Cardfile doesn't it? :-)

Imagine using the Falcon as a operator's switchboard thing -- you could have a headset, receive calls on one line, transfer them to other lines, whatever, all via a nice graphical interface. For computer users, it would be handy to be able to switch from modem to voice transmission on the fly. For example, you're connected to your friend with a Falcon at their house, say, and chatting (via a terminal program) or transferring files back and forth. Suddenly you get tired of typing all the things you could have said, so you go to the Phone menu and select "Voice" or something. Zap, you're now in Voice mode and you can talk into your headset. Then, you want to do some more file transfers so you go up and select "Digital" and now you're back to the standard modem thang.
I think there are a LOT of possibilities in this thread for integrating digital and analog phone signals (well yes they're all analog but you get the picture), and the possibility of using the Falcon for a phone controller is great also.

Hmmmm, are there really that few Atari users left?????
Not so!
This weekend I read the dutch Atari sales figures. They sold 3200 units, which is the same as the same quarter last year (yes 3200 in just one quarter (the 3rd so not even with Xmas)) and about as much as Apple has sold. Keep in mind that these were just the Personal Computer sales, so 1040Ste Mega STE and TT, not the Lynx.
This is very good when considering that the market in the Netherlands is pretty rotten at the moment. I think this is because Atari does not have that many competitors in the home market, except for those people that are willing to settle for a DOS machine which is not very suited for home use.

Erlend.

>They're weird bunch of guys there.

What exactly did Atari say? I'm curious to hear their raction to GW. Dave said that he got yelled at for three hours. I'd be surprised at any Atari official respond negatively to software for the ST, unless the Tramiels really _are_ morons... Which could very well be.
Put me down for someone who would buy GW, at just about any price and any level of support. The beta version is the best thing that ever happened to my ST.

Appearantly, Atari now claims to have never given the Wordflair
peeople permission to ditribute FSM, but I think the best quote from an
Atari online rep is still from Bill Rehbock, where he said FSM would
ship by Xmas if he had to do the packaging himself with Crayons. That
was last November. I guess there was a Crayon shortage or something. ;-}

Ah, Chris. Good to see you back.

The thing about Atari ASV is that is ASV -- Atari System V. That means that
you can buy off-the-shelf SysV 68K binaries and they'll run on your TT. This
is better for people who want to do serious Unix work, rather than compile
other sources.

I'm not saying that there's anything wrong with compiling your own source,
or indeed playing about with Unix. It's just that ASV is aimed at a
different market.

What's more, the same company that did the Atari Unix port also did the
Amiga SysV port, and the Mac SysV port.

You're right about the price tho'

I've tried this driver with the old gdos and Wordup 3. It is much faster than the original, and works quite well, except it seems to get the page size wrong. I had to move my paper off ceter in the printer to get Printouts to center, and if I try multi page printouts, the length drifts a bit each page. I guess this is probably Wordup's fault, but hads anyone else had the same problem" Naturally, fontgdos doesn't work with Wordup 3, and neither does NVDI.

6789. Networking a ST to a SUN.

Newsgroup: comp.sys.atari.st
Date: 1992-12-08 23:24:17 UTC
From: stevem@solbourne.com
Message-ID: <1g3ar1INNalh@katmandu.solbourne.com>
Source record: 213547
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have a SUN SPARCstation clone at home and was thinking about
dusting off the old 520 ST and somehow networking it to my SPARC.

So is there a NFS type program for the ST? We have PC's and MAC's
networked to our SPARC's here at work so I'm sure I could get a MAC
emulator and run that software, but I'd rather not. If all else
fails I could hook up a null modem connection but that is really
a jerry rig and not I'm looking for.

So any clues for me on how to do this?

Why do I want to do this? Just for the hell of it I guess.

Thanks...

Yes, but I pointed out why this wasn't much of an advantage in the rest of
the posting: lack of support, training, upgrade path etc.

What is more, many UK dealers are giving away stuff like Ami Pro with their
machines. The local Mac dealer here does very good PageMaker 4 deals with
new machines...

>to do more stuff to output to a VGA monitor or something?

The 1224 and TV use interlaced video. That means that it only has to output half as much data per video frame.

>2) Will a VGA (standard, like the $240 kind) monitor do overscan? Will a
>multisync?

The Atari docs say overscan is not supported on the VGA. I haven't found any way to try it. You can do anything you want with a multiscan monitor that supports the correct frequency range. To work correctly with the Falcon or any ST, a multiscan monitor has to support vertical refresh rates from 50 to 70 hertz and horizontal scan rates from 15.75khz to 35.7h khz. However, when using a multiscan monitor with the Falcon, you still have to use an adaptor plug, which will be set for either 1224 mode or VGA mode. When set to VGA mode it will behave exactly like a VGA monitor, i.e., 640x480 noninterlaced, no overscan. When set to SC1224 mode it will do interlace and overscan.

>3) Is there any monitor out there besides the SC1224/SC1436/TV which can do
>80 column 65536 color mode without interlace?

If you mean, besides a multiscan monitor, I don't know.

prices, and a 4 meg model with HD is $1199.00 US. A VGA color monitor
runs about $200.00. You can't use the 19" mono on the falcon, so the
price is irrelevant.

>the Falcon?

SCSI-2 has both a 16 and 32 bit option, but the basic implementation is still 8 bit data. What you've probably seen are 8 and 16 bit controllers for PCs. The distinction there is how wide a data port the controller presents to the PC's ISA bus, and is of no relevance on real computers.

SCSI-2 also has a "fast" option, which doubles the maximum clock speed on the data bus. All of these options are interchangeable and are negotiated independently by a particular SCSI device and the host adapter (or other target device) that is being addressed. Currently there are a few devices out that support 16 bit "wide" SCSI, and some that support "fast" SCSI, but very few devices that support both 32 bit "wide" mode and "fast" mode.

I haven't been able to benchmark the Falcon SCSI-2 port yet, and Atari doesn't explicitly state the bus speed. However, judging from some other access times they list, I'd expect it to max out around 4 MB/sec. This is just a guess, tho.

The STm's, STfm's, STe's, Mega STe, TT(?) and Falcon all have the RGB to composite and RF modulator circuitry you require. However, you really need the TT or Falcon to be able to display SVGA quality graphics. The Falcon is not yet available in the US.

You could handle this problem more easily by buying an external encoder. There was also a project in Radio-Electronics magazine that would handle this conversion. (Don't remember the issue, check the 1991 index.)

>It was bundled with WordFlair, but never came out on its own...

While yes, it's true that FSM has never been released on its own, this really comes as no great surprise to me. The original GDOS was relesed in the same manner: you had to buy application X, Y, or Z in order to get it.

Now don't misunderstand me. I'm not saying I support this form of distribution, I'm just saying that a precedent has been set. I wish FSM was made available to the general public, or, better yet, included with every machine for free. As least Atari seems to have wised up to some degree, releasing FONT GDOS for free.

As for the delays, well, this IS Atari we're talking about (not that other companies are much better. How late was System 7? Any sign of Windows NT?). As for Atari lying, I think that's a bit harsh. I don't think Atari was deliberatly trying to decieve people.

>How is a closed architecture BETTER? Don't say they're cheaper,
>because they're not anymore.

What's wrong with open architectures is that they promote an alphabet soup of 'standards' for graphics, disk interfaces, printer drivers etc. They converge eventually but it has taken the IBM world years to get to where the _closed_ Mac was when it was introduced. And I still see people using word processors on IBMs that give output that looks like it came from a typewriter. "Proportional spacing... what's that?"

All the various standards and configurations make it necessary for developers to support a wide variety of drivers, and make software installation much more complicated. There's a reason the average number of applications used by most people with clones is only slightly higher than 1; on the mac it's higher than 4.

>Yes, but will it satsify your needs in 1999, when ISDN is ubiquitous,

If this is true of all computer components, everything on your desk (save the case perhaps) is exchanged every five years. Why not just do it all at once every five years instead of continuously. Come to think of it, every PC owner I know has done just that; nobody actually upgrades from an XT to a '386/486 and you know it.

>Dave said that he got yelled at for three hours. I'd be surprised at
>any Atari official respond negatively to software for the ST, unless
>the Tramiels really _are_ morons... Which could very well be.

Since you asked, and since I've recently been accused of being "too
hard" on Atari, I'll give the details of our visit.

There is no exaggeration in the following -- I had (and have) no reason
to make anything up here, and I certainly have no desire to incur a
libel suit (see below about Leonard the Atari Legal Attack Dog). I
went out there feeling very optimistic, and I still have many fond
memories of the Atari world and ST hacking.

But I was completely and utterly astonished by their utter idiocy. My
fears about Atari's future increased 100-fold just because of that
visit.

Example of technical idiocy: We told them weeks in advance that we
were bringing a Syquest cart, and "Would there be a cart drive there?"
They assured us there would be. And, lo and behold, there was! But
they spent about an hour cobbling it together, and then proclaimed that
my cart couldn't be read because it was formatted with "shitty third
party software." (I'm sure ICD would be pleased to hear their
opinion.) They scrambled all around and found something else, which
they claimed would "fix the problem." I went along with this, assuming
they knew what was going home.

After our meeting they cited our bringing "incompatible third party
media" as a reason they were unimpressed with our "presentation" (which
we couldn't actually give for all the heckling). I was a bit
dumbfounded, but I didn't say much in response, thinking it best to
just let it go. But I found later that there AREN'T any problems
reading ICD formatted carts in other Syquest drives. They had simply
booted up C drive and looked in it, found it empty, and proclaimed some
problem in ICD's software. But the C partition WAS blank -- I didn't
put anything on it -- I put everything on D! It had been working just

fine -- they wasted an hour of our (and their) time for nothing.

When they finally got things set up, people just wandered in and out randomly, like we were at some holiday party or something. We were told that one of the employees was "really mad at having to come in that day so we'd better do a good job." (And, indeed, he bitched *non-stop* and asked obviously irritating questions over and over, even after we'd given a simple answer like, "Yes.")

What the hell kind of treatment is that for developers that have paid their *own way* out to Sunnyvale to show you some game development software for your new machine which you want to pitch to GAME COMPANIES. They told us all about their grand plans. All about how they'd be moving 30,000 Falcons a month in August. All about how EA, etc. were going to write games for it. (With no game development system, of course.) We were horrified at their naivete. We were furious at their rudeness and lack of professionalism. They actually told us that some of the peons from the Lynx group were "angry that we'd wasted their time." That WE'D wasted THEIR time?!?! Wanna reimburse us for the $3000 it cost DC to make that trip, Atari? How about the 5 days WE wasted flying our butts out to be abused by you?

Bill Rehbock was the only person that behaved in an even slightly professional manner. (The TT dev people, whom we knew already, weren't involved in the "meeting," but they were also very supportive) I have got to give Bill credit; he was the only person who seemed to have any *clue* about the reality of the situation at Atari. He was the only one wouldn't have been perfectly happy with us leaving so angry that we'd never do anything but write malicious viruses for Atari computers again. (No, we never have, and we won't.)

The only questions Leonard Tramiel could think to ask were, "Does your stuff run on the TT?" (Yes, as we explained in detail at the start of "meeting.") and "What would your reaction be if we sued you for copyright infringement for HacMan II?" As Dave Barry says, "I AM NOT MAKING THIS UP." What POSSIBLE relevance did THAT have?!?! Aside from being completely absurd (as if pacman has any sales potential anymore anyway, and as if I made any money off it), it was totally unrelated to the matters at hand.

To give you an idea of the kinds of criticisms they had, they were *very* hung up on the fact that Animatic had 16 palette boxes, and hence "obviously could never be made to work with 256 colors." As if the screen layout is impossible to change. (And as if we were supposed to develop a system that supported the Falcon before we ever even saw a Falcon!) They were also very mad that Animatic won't import Deluxe Paint images, because THEY only use Deluxe Paint on the Amiga. (As if it would really be hard to add an IFF loader. Come on, it's not like I don't have the format -- grin.)

They complained that we didn't have real-time sprite scaling and rotation, an omission which they felt made the system terribly

technically inferior because "the Lynx has it and it's only a 6502-based machine." But the Lynx has *hardware scaling and rotation bulit in*. I was amazed to find that I knew more about the Lynx hardware than the Lynx programmers! (I was also amazed that they thought you could actually do real-time rotation and scaling on the ST without massive precalculated tables in anything but a specially-coded demo. No commercial ST games do that, that I know of.)

The real kicker is that GW does have image scaling and rotation routines, so if you *really* feel the urge to try making a game that runs fast enough to be playable using real-time scaling and rotation, you can do so easily, by hooking your own image manipulation code (that just calls the GW scaling/rotation routines) into the GW kernel using a simple technique they *refused* to let me describe! I just never bothered to hook scaling and rotation into the sprite code because it would probably never get used.

They then proceeded to show us their beloved Lynx development system, which they think is the best thing ever. It runs on an Amiga. THERE WERE NO Atari machines being used by the game developers at Atari. And they groused that the management had been asking them to start trying to work with TT's, saying that if they moved to Atari machines they'd lose their favorite Amiga text editor, and that they just WOULDN'T BE ABLE TO PROGRAM WITHOUT IT.

I just wanted to grab them by the lapels and shake them. (This all not even cosidering the fact that the "awesome" Lynx system doesn't even have the concept of a "film" or "sprite" -- you have to tack frames together "by hand" by drawing them on the screen in the right order. Give me a *break* guys -- arrays and linked lists are NOT new concepts.)

I guess Bill gave us a Falcon to make us feel less like ripping the heads off every Atari employee we dealt with there. But that doesn't change the facts of the day.

Did I mention that they BET us that we couldn't finish the ST version of Vindicators before they could? Dave Staugas had been working on it for about 6 months, and when we commented that the game would be fairly straightforward with GW, their response was not, "Really? Then tell us how you'd do it, wise guy" but instead "Oh yeah, well Dave Staugas just sucked anyway, so it's no surprise he took so long. *I* could write it in a week."

Kind words for the guy who wrote NEOchrome, huh? I suppose we can only hope for his sake that "Bea" hasn't stabbed him in the back too. (Whoever she is.)

So there you go. That's the way it was. Atari, RIP.

Yes, Howard, but is this a because of the Falcon's hardware, or because of a limitation with the monitors themselves, or the connector between the monitor and the computer, etc. I ask not because I want to bash the Falcon (really), but because I think there are boards for the PC that do 32K colors ("HiColor boards"), and I don't know how to reconcile this with your claims.

Regarding the "failure" of WordPerfect and Borland in the Atari marketplace...

There was a long history of friction between WordPerfect Corp and Atari Corp. Atari development people claim the Atari programmer at WP was a "prima donna" and hard to get along with. The WP people say they never got much cooperation fro the Atari people who were supposed to be helping them.

Now, if YOU were trying to get a major software company (one of the largest in the world) to port their product to your computer so that you could sell untold thousands more computers, don't you think you could get along with an individual during the hours of 9 to 5..?

With failing sales and the difficulty of working with Atari, I don't blame WordPerfect Corp for cutting their losses and dropping the axe on further development.

As for Borland, they did what a lot of companies are faced with doing.. they decided not to distribute a product in the face of almost certain losses.

Consider this.. if a company like Spectrum Holobyte can only sell 700 copies of a very popular game like "Flight of the Intruder", how can Borland even hope to make back the cost of printing the manuals for a "specialty" product like their C compiler..?

They're not in it for the "fun" of it, or because of any misguided "loyalty" to a computer line, but to sell their products for a profit. If they can't do that, or if selling their products will incur a loss, they get out.

Atari has done it too.. look at the products they've either dropped, or never sold, because of the same kinds of things.

BobR

>else.

an additional flaw in the all or nothing catagory is the assumption that
you can make money only by selling software. you can make money off of
sw by:
selling hardware with pirated software
selling support for sw (1.900.cant.rtfm)
selling books on how to use a package.
giving classes on how to use a package.

I'm sure you can think up more if you are clever enough to program or
post articles on the net.

Problems running some programs after upgrading an ST to 4 Megs..

As Steve Wells mentioned, TOS Error 35 is not likely to be caused by memory problems (unless something about the upgrade is scrambling something.. unlikely, since other programs still run consistently).

There ARE some ill-behaved programs that were never tested on 4 Meg machines that will bomb with a bus error (er.. I forget how many bombs) when they try to go over the 4 Meg limit.

One solution might be to try a utility called MAKE512.TOS which works like that RAM EATER TSR on the PC.. it should be available at atari.archive...

6804. Falcon Screens & TOS 4.0

Newsgroup: comp.sys.atari.st
Date: 1992-12-09 02:34:49 UTC
From: wells_s@kosmos.wcc.govt.nz
Message-ID: <1g3m09INNoca@golem.wcc.govt.nz>
Source record: 213466

Could some kind person, owning a Falcon - gives us folks some screen shots of TOS v4.0, or even MultiTOS if you are one of the rare couple who has a copy. ST-Medium Resolution, or monochrome modes would probably be the best, (Using TT res's could be a problem 8-)

If this isn't 'illegal' or any such problem - many locals, (and probably prospective buyers etc.) would probably interested in seeing what this new Desktop looks like! (preferably with plenty of assortment on the screen 8-)

Please!?

Also, is there any chance of someone LZH'ing/ZOOing, (or whatever) the files:/

giftoppm (in the file ppm.zoo)
pnmscale ("" pnm.zoo)
ppmtoraw ("" ppmtoraw.zoo)

As, the entire files are a little on the large side! (over 1meg of downloading to get them, *if* I'm looking at the right files!)

filenames may vary, but the first converts GIF to PPM format, the second scales the pictures, and the third converts the scaled (or not if you want) PPM pictures into RAW format.

or if someone can tell me where I can get these files!

(The ppm-bin.zoo file and pnm-bin.zoo files on atari archive are somewhat huge, and without a Hard-Drive (sob) it's pretty awkward to extract ZOO files that large! (without a lot of disk swapping)

Again, Please!?

Thank-you in advance!
(Now with a smaller signature 8-)

For Sale:

- Atari 520St, expanded to 1 Meg Ram, with mouse

- Atari sc1224 color monitor

- 2 DS disk drives (sc314??)

- Epson LX-80 printer

- Supra Modem (2400bd) with Flash 1.6 software

Prefer to send it all to one lucky customer, but willing to sell each
object individualy if necessary. Please make an offer and E-Mail me at

briningj@sage.cc.purdue.edu

6808. IMG files in LaTex? (Or: CSG - how to use?)

Newsgroup: comp.sys.atari.st
Date: 1992-12-09 03:16:42 UTC
From: warwick@cs.uq.oz.au
Message-ID: <11377@uqcspe.cs.uq.oz.au>
Source record: 213468

When I installed CS-TeX, I didn't have much room on my puny 30M harddrive, some I deleted some of the files... including, it would seem, that which described how to include IMG files in a CS-TeX document, I presume by using the "CSG" DVI-extension.

I would *REALLY* appreciate any info on this.

[I'm getting sick of using DTP programs just because I want an image in the document]

>Scott

A while back I tried to upgrade STOS myself to work with TOS3.06 (TT TOS)
It took a while but I finally ended up with a version of STOS that
worked on my TT without bombing. Unfortunately, STOS does naughty
things when accessing VDI that I couldn't fix. The result: none of
the VDI type commands work (i.e. circle, line, earc, etc...)
I wrote Mandarin pleading for help. They told me Francios Lionet (sp?)
the program author, was doing AMOS professional and would get around
to STOS when he was off vacation (this was 3 months ago). I'm not
holding my breath waiting for a TOS independent STOS.

Oh PLEASE. I'd imagine 640x480x16colours is the most realistice mode to
use/view. Please send a [degas] image of the top-left corner of the
screen, in ST-low format, or simply use ST-low on the Falcon - uglier,
but maybe easier.

BTW, have we all looked at the pre-release screen snap-shots of
MultiTos at a.a - interesting (but of course, in monochrome, since
it was just a pre-release version, probably running on an TT!).

Take a look at a November 30 article in this newsgroup titled
welcome to comp.sys.atari.st, and in the section labelled ERR (about line
396 or so...) you should see a list of errors that TOS gives. TOS error 35
is a problem I've had when the file has become corrupted, since the program's
basepage contains information on how the file is set up.

To my knowledge there's no reason a VGA monitor cannot display as many colors as you want in its full resolution. The limitation is obviously in the Falcon, and as I mentioned before, the true-color mode on the Falcon would consume too much memory bandwidth in 640x480 resolution, noninterlaced. I thought I had made that pretty clear by now. You are either not receiving half of my posts, or you're just not reading them carefully...

Source record: 213478

In article <ByxMC4.Grn@undergrad.math.waterloo.edu> papresco@cantor.math.uwaterloo.ca (Paul Prescod) writes:
>With all this talk about DSPs on the motherboard, I have a few
>questions:
>
>1.Can a DSP do anything that a fax/modem/soundcard combination can't?

Yes. The DSP is a general purpose coprocessor, with the main focus of its instruction set on mathematical operations. See point #5 below. As to the instructions, to give you a general idea :
24x24 bit multiply
56 bit addition
two data moves
two address pointer updates
instruction prefetch
* these can be executed in one instruction cycle, by the way.

>2.Does a DSP need the high-bandwith motherboard bus?

Well, I think that depends on what you want to use it for. Many DSP programs will probably be able to work just on external data (ie what they get from the DSP port itself), but then some will also need to swap lots of stuff to and from main memory. As many people have pointed out, the DSP has its own bus and 96Kbytes (32Kwords, and each DSP word is 24 bits). The DSP subsystem is driven at 32 MHz, yielding 16 MIPS for the 56001. The interface between the DSP and the CPU can transfer data at about 1 MB/s.

>3.What Falcon applications exist that take advantage of the DSP?

Well there's that Voicemail thing that keeps popping up. :) I don't know that any applications can be said to _really_ exist beyond that, but likely applications include a low-cost FAXmodem, an external box to provide full 8-channel audio inputs and outputs, and probably some video digitizers and effects boxes. Oh, also Atari's Audio Fun Machine probably uses the DSP to do its real time sound effects. This ships with every Falcon030.

>4.Can existing applications use it for anything?

Applications have to be specifically designed with the DSP in mind. Of course, you could write a program to autodetect the DSP and use it if present, but programs not written with the DSP in mind will not benefit from it.

>5.Can it be used for anything outside of multimedia? i.e. speeding up
>number crunching?
>

Indeed. The DSP can be used for anything you want to use it for. Atari has shipped the DSP development system which includes a separate compiler and tools for writing DSP code. I assume this code is then somehow linked with your 68030 code and your program then calls the DSP routine as it chooses. Here's some possible applications of the DSP :
Sound compression/effects/noise reduction, etc.
Virtual FAXmodem
Speech recognition/synthesis
Vector processing/3-D graphics calculations/ray-tracing

Of course, DSP is still fairly new I think so it will take a while to figure out just what can be done with it (speaking generally, not just for the Falcon).

And, a general comment : I don't see how having an onboard DSP can be seen as disadvantageous -- frankly, I'm astounded by the recent posts of some people claiming as much. I think Atari is making a good move putting a DSP in their next computer, especially since most people agree DSP will soon become commonplace in computers. Whatever the Falcon030's flaws are, the DSP is definitely not one of them.

Regards,

You may look for the KA9Q port to the ST. It does SLIP, and you can use
ftp and some other TCP/IP utilities. Porting NFS for MiNT should be
possible, but I don't know that anyone has done it.

Nice, a bit like the way the Amiga does it (as I'm told), but remember
that a 880x608x16 screen would consume quite a lot of memory. I'm
wondering whether AES still keeps the quarter-of-a-screen buffer; in
that case 1Meg Falcons would definitely NOT be a good idea...

I cannot believe why people insist on the fact that DataDiet is the only program of its kind for the ST. I know of several attempts in the PD, and a very successful commercial package called DataLight (the name was coined *before* DataLight). This program compresses the whole partition in one go and then packs/unpacks on the fly, thus working much more like Stacker et al than the file-oriented DataDiet.

DataLight 2.0 costs DM 129 if I remember correctly.

>With all this talk about DSPs on the motherboard, I have a few
>questions:

>1.Can a DSP do anything that a fax/modem/soundcard combination can't?

The 56001 is a fully programmable processor, with all the flexibility that this implies. It has been particularly optimised for signal processing by the implementation of such features as multiple busses, single cycle multiply and accumulate, and zero-overhead looping etc.

>2.Does a DSP need the high-bandwith motherboard bus?

The DSP has its own busses, separate from the 68030, and yes, they are high bandwidth (30ns RAM, 32MHz I believe)

>3.What Falcon applications exist that take advantage of the DSP?

See postings from Howard Chu about fax, voicemail, modem applications. Also expect to see lots of software for musical applications (effects, digital mixing, surround-sound decoding). When I get a Falcon I will be writing these and releasing as shareware... (I am an experienced DSP programmer, though mostly on 25MFLOP DSP32c floating point processors :-)

>4.Can existing applications use it for anything?

No - it needs specifically written software to be any use.

>5.Can it be used for anything outside of multimedia? i.e. speeding up
>number crunching?

Number-crunching is probably best left to the 68882, though in principle the answer is yes. You do, however, have an overhead of getting the data into, and back from the DSP RAM. Anyone know how big this overhead is?

Hah, and last week this 486 machine (3 months old) here at our
university spit out the message (in those big 40 column characters, on
this expensive Philips SVGA monitor with Tsenglab card....):
NO ROM BASIC
SYSTEM HALTED.
and then nothing. So the I*M market has been upgrading ??? :)

>Microsoft actually has TWO notable products; the "standard" QuickBasic
>that's an upgrade (a BIG upgrade) from the classic GW-Basic. It's not
Great, it doesn't even come with a manual. The only thing you have are
the few example programs....

>The more notable thing is the recent "Visual Basic," which seems to be
>a GUI rapid-prototyper.
Great program. I tried using it. But it still lacks some access to the
GUI. And programs cannot really be compiled as they rely on a dll
(dynamically linkable library), so something like the runtime libraries
required for the older GW-basic programs.

Erlend.
(By the way, I am a real BASIC fan, although I only use it occasionally
now.)

Postscript is ASCII. It's actually quite related to FORTH source code, and a year or two ago I wrote a quite impressive program in PostScript to draw a 3D graph. Took ages to write, but watching a Qume Crystalwriter stop for 15 minutes working out a massive loop and then produce a shaded 3D image at full 300x300 resolution was worth it.

The problem with most commercial products that output PostScript is that to save on transfer time they get rid of all the CR/LF codes so reading it is impossible...

6829. Piracy of software

Newsgroup: comp.sys.atari.st
Date: 1992-12-09 13:13:59 UTC
From: naffara@crc.ac.uk
Message-ID: <1992Dec9.131359.23979@crc.ac.uk>
Source record: 213489

I have heard a lot about PC users (and sometimes others) copying software.
Just imagine if we actually told the software companies (or whoever does it)
the names of everyone who has illegal copies of software. This would probably
be at least 90% of PC users and most of all computer users everywhere.
I know for a fact that a lot of businesses buy 1 copy of a program and then
copy it onto all their other machines.

This would almost certainly force a lot of people to BUY their software and
probably register for shareware etc. (it's a similar sort of thing. "Why should
I send off money for what I have already?)

This would mean a huge leap in profits for dealers, software producers etc
and probably reduce the number of PC's being sold. (If I buy one of these PC's
then just look at all the software I can get for free from work, friends...)

Personally, I have not got any illegal copies of programs from anywhere else,
but I do like to make a backup copy in case my 100+ pound disk suddenly goes
wrong.

I am considering phoning companies with names of people who have these copies
but to have any effect lots of others will have to do the same.
(there's no reason why you can't do it anonymously!)

Just a wild idea I came up with after sifting through all those posts...
Phil
(E-mail naffara@uk.ac.crc)

>There was a long history of friction between WordPerfect Corp
>and Atari Corp. [...]

>With failing sales and the difficulty of working with Atari,
>I don't blame WordPerfect Corp for cutting their losses and
>dropping the axe on further development.

I think the main reason for WP to discontinuing the Atari line
was that they figured they wouldn't make much sales with WP for
Atari. Why didn't WP for ATaris sell? Because it simply could not
compete with other Atari word processors.
The friction between Atari and WP may heve prevented optimal
support and technical information flow from Atari to WP, but this
alone cannot account for the immeasurably low quality of WP for
Ataris. Any hobbyist can do better, as proven by the amount of
decent PD or shareware editors around.
IMHO, a more sensible way for WP to cut their losses would have
been to get a competent programming staff. It seems to me that
their discontinuing of the Atari line will also harm their sales
on other systems, since a main argument of theirs for their
product is the availability of WP on many platforms.

>As for Borland, they did what a lot of companies are faced with
>doing.. they decided not to distribute a product in the face
>of almost certain losses.

>Consider this.. if a company like Spectrum Holobyte can only sell
>700 copies of a very popular game like "Flight of the Intruder",
>how can Borland even hope to make back the cost of printing the
>manuals for a "specialty" product like their C compiler..?

Hmmm... I think the pirate/legal copy ration is much higher with
games than it is with products like compilers. Firstly, a serious
compiler user will typically have a larger budget than a typical
game player (think of all those kids). Secondly, a serious
compiler user will want a manual, telephone support, and contact
to other programmers in user groups of some sort. All these
reasons lead to a much increased motivation to buy a compiler
than to buy a game.

>They're not in it for the "fun" of it, or because of any misguided
>"loyalty" to a computer line, but to sell their products for a
>profit. If they can't do that, or if selling their products will
>incur a loss, they get out.

ASH seems to do quite well with the Pure languages, therefore I
fail to see why Borland shouldn't have been able to sell their
compilers for a profit themselves.

I did read your posts carefully, and there's no reason to insult my intelligence, particularly when at least one other person had no idea what you were saying either. Your last post said something along the lines of, "You can't do 640x480x16 because there's not enough bandwith -- you'd have 2% left over for the CPU." I just wanted to know what, exactly, you meant by "bandwidth," and whether there was something inhernently nasty about VGA monitors that required such "bandwidth." (I doubted it, but then I doubted your original claim in the first place.)

Source record: 213498

Well to everybody out there, the true, and this is correct.

The speed of the falcon is 3.8 MIPs and it does have a true 32 bit BUS.

The FALCON is going to be the new machine, the machine of the future. It has a slot inside on the mother board which is
capable of holding a 386SX processor which means that it shall be able to directly emulate a SuperVGA IBM PC compatible
machine with no truble what so ever.

Get the FALCON, support the FALCON, it is the new machine, it is the future.

If you want to now more about the FALCON write to my mail address and I shall send you the latest word of the FALCON.

MI WINTER.
E-Mail : wintermi@cs.aston.ac.uk

6838. Re: The Great Falcon Debate

Newsgroup: comp.sys.atari.st
Date: 1992-12-09 14:58:28 UTC
From: wintermi@cs.aston.ac.uk
Message-ID: <1992Dec9.145828.2736@aston.ac.uk>
Source record: 213402

Well let me tell you something, the FALCON is an excellent machine, and does not have a 16 bit bus as you said, it has a full
32 bit bus. The machine if you wait is having a re-design. The casing is being completely re-designed. Wait for the end of
January, you shall see that I am right.

The FALCON has loads of excellent reasons for buying it.

1. It has an excellent graphics capability.
2. It has breath taking 16 bit stereo 8 channel sound.
3. It has a built in 16 bit sampler, and output to headphones or an amplifier.
4. It will be capable of full genlocking video titling etc...
5. It will have a multi-tasking operating system. (Out in the next year)
6. It has a SCSII II port enabling any peripheral including a CD ROM drive to be connected to it.
7. In the Autumn of next year you will see the full use of the FALCON in CD-I drives.
8. The price is absolutely amazing for all of these goodies.
9. A 386SX processor can be directly plugged in enabling emulation of a SuperVGA IBM PC compatible with no
trouble at all.
10. It has a DSP chip inside running in parallel which will enable sound and image processing to be done directly
with input from the DSP port at the rear. Also this chip could be used to perform breath taking 3D graphics,
with raytracing and shading done to produce the best graphics in TRUE colour at a speed unknown to any other
home computer. As the DSP chip runs at an astonishing 16 MIPs in speed. Combine the two processors, running
in parallel and you have an amazing speed possible for all aplications where mathematics, graphics or shear
speed are needed in processing.

Buy one as soon as possible, support the FALCON.

MI WINTER.

6839. Weird harddisk-driver error

Newsgroup: comp.sys.atari.st
Date: 1992-12-09 15:12:56 UTC
From: ms@lehre25.informatik.Uni-Bremen.DE
Message-ID: <1992Dec9.151256.10158@informatik.uni-bremen.de>
Source record: 213404

I have problems with my harddisk-driver: It is unable to read SOME files.
If you use the following combination of Hard- and Software:
Seagate ST 277N SCSI Harddisk
AliaSCSI SCSI Adapter (from c't)
AliaSCSI V 1.6 Harddisk-driver (from c't)
Atari 520ST+

then LZH is unable to READ LZH files from the Harddisk (but able to WRITE them), CS-TeX TeX can't
read SOME format files and CS-TEX GFtoPK can't read SOME PK-files.
The problems are reproducible and don't occure if you use an Atari 1040ST or another harddisk-driver
(AHDI works very well, but it is slow).

Since this problem occures only in a certain combination of harddisk and computer, my questions are:
- Has anybody a solution for my problem? I have the source code of the driver and are in contact
with the developer.
- Are there any differences in the DMA-Chips in the 520 and the 1040?

Hope somebody has an answer.

I don't know about Signa, but Kuma at least are still in business. They are concentrating on books (including some for the ST) - I just got some junk mail from them. They have handed their software onto Hisoft, who now have an even bigger range of ST programs than before.

By the way, did you ever find out what the difference between an SM144 and an SM146 is? It does not seem to be that the SM146 has no speakers, as you suggested in an earlier message.

Source record: 213369

Something which has been bugging me about this thread is all the talking about how easy it is to upgrade a PC by just swapping the motherboard, etc. You don't just pop out the MB and stick in another one. You have to disconnect the power supply, hard disk, floppy drives (completely removing the latter two), etc. Yes, you can do it. But it is analagous to the discussion about gcc; it is something that tecchie types might have no qualms about, but not general users. Me, I don't feel comfortable performing major surgery like this, knowing that if I hook up the power supply the wrong way or zap a chip somewhere that I just blew a $150 to $500 investment. If something does go wrong, I won't have any idea where to look for it. I helped a friend do a simple memory upgrade and the end result was a seemingly dead computer. It took hours of messing around to get it straightened out. Reading through comp.sys.ibm.pc.hardware it seems I'm not alone.

>This would mean a huge leap in profits for dealers, software producers etc

After taking four years of classes with other computer science students at Cleveland State University, I have determined that most if not all of the capable students have a double major: computer science and piracy.

The rationalization of piracy seems to be as follows:
1. "As long as I don't charge any money for it, it's okay."
2. "I'm just learning the language. When I sell the programs for money, then I'll pay for it."
3. "Who will ever catch you?"
4. "Pay for it? Are you crazy? I'll never be able to come up with $200 for that!"
5. "Everyone else does it, so why shouldn't I?"

Each time that I have spoken about this, and stated my belief that it is wrong, students quickly give their rationalization to defend themselves. On occasion, there is ridicule and rejection.

The students are from various religions, or none at all, and yet the attitudes and rationalization are the same.

What will prevent a person from becoming a pirate is either a strong external force that successfully catches the pirate and penalizes him in court, or a strong internal belief that it is wrong, and that the consequences of doing wrong far outweigh any benefit the pirated software may bring.

I am of the latter persuasion, and will respond privately to anyone who wishes to discuss life's intricate laws of cause-and-effect.

A few months back I ordered a copy of PrintMaster Plus for the ST. The box contained three floppies, a 3.5" ST floppy, a 3.5" DOS floppy and a 5.25" DOS floppy. Turns out the ST one was copy protected (so I had to borrow a Blitz cable to back it up) but the DOS versions are *not* so if I wanted to I could:

1. give them away

2. sell them

3. copy them and give multiple copies away

4. copy them and sell multiple copies

So why is the version that *I paid for* protected, yet they throw in unproteced versions that are of no use to me (therefore prime candidates for piracy). I'm sure piracy of the ST version would be pretty insignificant versus the DOS version anyway. Why do software companies do this sort of stupid stuff, anyway?

As a passing point of style, from a person who has produced Post-Script programs for in house use @ BAe SSL, a well written program to output Postscript will NOT output files which make intense use of the printers processor. This causes large backlogs on the office PS laser (expensive), where-as the majority of the processing should be done one the computer PRIOR to outputing a PS file (cheap).

>The problem with most commercial products that output PostScript
>is that to save on transfer time they get rid of all the CR/LF
>codes so reading it is impossible...

This is because they aren't intended to be read by anything but other machines.

This is nonsense. Dave and Neil have absolutely tried their best to
get GW released, and are not to be blamed for the failure of Double
Click Software to bring it to the market.

GW is the best thing to happen to game design for us mere mortal
programmers, who don't have years to design, code, debug, and test
commercial quality game engines. Neil and Dave have spent a good portion
of their otherwise free time working on the project, and deserve only
praise for their efforts. All of us involved with the beta testing of
GW were very, very happy with the results that we were able to achieve
using this game library.

To give you an example: I was able to create an Asteroids game in about
20 hours worth of work. That includes the time I spent coding, drawing
the sprites, mucking about with sound samples, and playtesting. (Mostly
playtesting. :) And, that was the first time I used GW.

You can run it from a shell like msh or gulam and enter -? to get the usage. or you can just enter the name of the file to unarc in the window that pops up. The ttp extension stands for TOS Takes Parameters. If the extension is .arc I beleive all you need to enter is the name of the file.

I can send the usage pages to you through email if want.

I would also be interested in purchasing the Game Workbench system. Are
you guys (Dave and Neil) giving any serious consideration to a way of
releasing it yourselves? I can see that support would be a terrific
headache, so I can't make any judgements on the practicality of it, but
I would very much like to see perhaps a small demonstration program, and
hear about some prices you fellows consider realistic.

[...]

>I am considering phoning companies with names of people who have these copies
>but to have any effect lots of others will have to do the same.
>(there's no reason why you can't do it anonymously!)

Really no reason?? I can think of many. To say the least, I'd
feel rather uncomfortable if I met someone again who had to pay a
terrible indemnity for having pirateware because I called some
company anonymously.
Besides that, I doubt that a software company can make much use
from such anonymously given information. If they want to sue
someone for pirating their stuff, they need hard proofs for that,
and I strongly hope they can't have someone's house searched by
the police or something if the only reason for suspecting that
person is an anonymous call or letter.

>Just a wild idea I came up with after sifting through all those posts...

Your idea is based on the assumption/point of view that people
who have pirated software are the bad guys and software companies
that own the rights on this software are the good guys.
Completely black & white, completely one-sided.
I don't subscribe to this point of view at all. This way of
looking at things overlooks the central fact that software piracy
is tightly coupled to software overpricing, and that these two
form a dynamical system (commonly known as a vicious circle or
a catch-22) in which amplification of one part tends to amplify
the other part.
Viewing things in this light, it immediately becomes clear that
defining one side as the good guys and the other side as the
villains will not help solving the problem at all.
Suppose we all rushed to our phones and told software houses
about people we knew who use their stuff illegally. You say this
will boost the profit of the companies. Most probable result?
Bill Gates will spend his next holiday on the moon :-). More
seriously, many people would not be able to afford computing
anymore, thus the computer community would shrink in size. The
overall creative power of the computer community would be
substantially reduced, and the "alternative" computer culture
would be completely destroyed.

The sensible thing to do in order to get out of a vicious circle
is to get all who are involved to cooperate to develop a new

concept that is free from the forces on which the vicious circle
feeds. Thus, what everyone can do and should do is to be open to
such new concepts, to support them, and to contribute ideas.

OXYD is great! It's so popular on our local BBS that we might ask the
authors to give us a cut on a bulk purchase of books. How far have you
progressed in the game?

>-- you'd have 2% left over for the CPU." I just wanted to know what,
>exactly, you meant by "bandwidth," and whether there was something
>inhernently nasty about VGA monitors that required such "bandwidth." (I
>doubted it, but then I doubted your original claim in the first place.)

Sorry, I had no intent (nor any reason) to insult you. However, in my other post, I specifically said, that at 640x480x16 resolution on VGA, the video hardware would consume 90% of the available *memory* bandwidth of the Falcon, leaving the 68030 to operate at an effective speed of 2 MHz. It seemed pretty obvious to me that there is no memory bus to speak of in a VGA monitor so it should have been pretty clear.

Meanwhile - I have no reason to lie, and I am not exactly hardware illiterate, so I don't understand what there was to doubt about my information...

Just going thru the numbers, the 640x480x8 mode uses 300KB/screen, and in noninterlaced video that means the video bus has to deliver 18 MB/second. As you may recall, this mode slows the 68030 down by about 50% (compared to the "cheapest" video mode). Now, double the color resolution to 16 bits, and that video bus needs a bandwidth of at least 36 MB/second. Even using 32 bit accesses, that means it has to deliver 9 million words per second, and if the bus is only clocked at 16 MHz then you're really out of bandwidth already. (Because it will usually take more than 1 cycle to fetch one word...) (Although, if it only takes 3 cycles to set up the first access and then the next 3 words are read in burst mode, then you can get 4 words in 6 cycles, and still squeeze under the wire.) The point being, you will either have no time left, or very very little, and in either case, it's not enough for the CPU to do anything significant.

Obviously the reason 640x480x16 works on the 1224/TV is because it's an interlaced mode there, so even though the size of the screen is doubled, only half of it is displayed on every 60 hertz frame, so the effective memory bandwidth used is the same as for 640x480x8 noninterlaced.

>
> Anyway, is there a way for me to fisk the drive? i.e. recover
> the directory (or whatever it is that was cleared)? Or do I
> just bite the bullet and start reloading everything?

You cleard FAT and ROOT-DIRECTORY. You have only very little chance to restore the data and this will be a manualy job!

At first you should remeber all DIRECTORY-Entries in the ROOT-DIRECTORY ans search for them on the disk (Folders and Files) and note the SECTOR-No and create a new ENTRY in the ROOT-DIRECTORY. Then you should try a Tool which allowes to restore this Folders and Files. But you have to use a Tool wich allows you to collect the sectors because the FAT can give no information. So you only might be able to restore TEXT-Files.

Having done that you should continue with this in any of the restored folders and so on ... :-((.

As you see this job will take you weeks!

Better bite the bullet wich will save you time :-).

Source record: 213435

I have $100-$110 (US) to buy myself a Christmas present. I've decided to get something for my Mega 2ST (w/ TOS 1.02, 2 MBs RAM, 105 MB HD, SC1224, SM??? [monochrome monitor], 720K floppy) system. I'm looking for suggestions.

It can be hardware, software, or a combination of both. However, I can't go over $110 (this is an extreme upper limit).

Here are some of the major packages that I already have:
PageStream 2.2
Lattice C v5
UIS III v3.1
LDW Power v1.?
Word Writer ST
GFA BASIC v3.0
I'm sure there are more, but I'm drawing blanks at the moment
Lots and lots of games

I'm not terribly interested in more games (though Populous II would be an exception if the right offer was made :).

So if you had this system, what you get for $100?

Sending replies by e-mail will be the most likely to be seen, but post if you must.

adTHANKSvance,
Kenneth Love

Not really -- encryption (as opposed to compression) algorithms are specifically designed to stop people cracking them by using fast number crunchers. They reply on the fact that breaking the code involves lots of algorithms that are NP complete (i.e. computable, but take longer than your lifetime to run!)

> This brings up an interesting point about the DSP - it should be possible

The latest version is 1.08 and if you can't get it from anywhere else you can get it from the support BBS in The Netherlands. It's number is:

(Your international code)3158153849.

It costs 150 guilders to register but you can get a demo key which lasts for 60 days. I've just registered and I think it's worth every penny. It doesn't handle multiple nodes, I'm afraid.

I am looking for a game I saw years ago (when I used to use my system).
It is called the Universal Military Simulator. I don't know who made it.

Anyway if you have it and would like to sell for a reasonable price
let me know, I'll pay shipping also.

If no one has UMS then I would also be interested in any tactical/strategic
level military games. Let me know.

Thanks...

Stevem

6874. Keyboard Problem

Message-ID: <1992Dec9.234828.24046@nntpserver.chevron.com>
Source record: 213427

The rightmost 8 keys on my 1040ST (3,6,9, on the numeric pad; ENTER, etc.) have begun to work intermittently. Lately, the times they do not work are beginning to outnumber the they do. Originally, a reboot usually solved the problem but now they may work for a short time and then quit.

Are there any educated guesses as whether this (A) an easily fixable problem which could be solved by reseating a connection, (B) something more difficult which would require professional intervention, or (C) the beginning of the end for my machine?

Thanks.

|>is tightly coupled to software overpricing, and that these two
|>form a dynamical system (commonly known as a vicious circle or
|>a catch-22) in which amplification of one part tends to amplify
|>the other part.

First of all, it is black and white. The software companies own the rights to the software and can sell at any price they like. You either pay for it or you are stealing it from them.

What you seem to be suggesting is that if the software wasn't that good, or if you felt you were overcharged for it, then it is okay to distribute copies of it. Sorry, two wrongs do not make a right. Regardless of the quality, they can charge whatever they like and if you think it is too much then you do without. What is needed is more information about the quality of a software product before it is purchased so you can make an intelligent decision whether or not you want to pay the asking price. That way, good stuff would sell and good developers would make money and bad stuff would not sell and the bad developers would go out of business.

In any case, you can not justify pirating software!

Randy

YES,
YES,
YES.

The Tramiels just might listen, you know. I get the impression that
they're trying there best with limited resources.

They gave Jeff Minter a Falcon, good move but small.

They hired Eric Smith, GREAT move. I'm ALL FOR the delayed Falcon waiting
for MultiTOS. When I saw Eric's question to the net in c.s.a.st.tech, I
thought "Yes, they want to do things RIGHT". They don't want to be the
IBM-Motorola-Golf-Intel story of future history.

>16 bitplanes -> 2 bytes per pixel -> 307,200 * 2 = 614,400 bytes.

>This is the incorrectly-called "true color" mode. That's the mode they
>wanted games written for.

Hello, Biff, anybody home?

They DO NOT "want games written for" the 640x480x16bit mode [note the
unambiguous "bit" addition]. Why would they? non-VGA, interlaced?

That mode is a novelty item only.

Somehow, it seems Dave just wants to slam Atari.

The modes appropriate for games are:

320x240x256col 75K
320x240x65536bit 150K
640x240x256col 150K, maybe (not 1:1 aspect ratio)
640x240x65536bit 300K, maybe (not 1:1 aspect ratio)

Some games will use 480-line modes, or have that as an option - since many
people will use VGA monitors with the Falcon (since they are cheap). But
then they can't use 640x480x16bit mode anyway. No games will exist for
that mode. Maybe an optional title-screen, nothing more (just like on the
Amigas - no-one minds an interlaced, HAM title screen, but TO PLAY ON???
doubtful, Dave).

dmb@rice-chex.ai.mit.edu (David Baggett) writes:

>I'm sure you will get flooded with responses to this, but the most
>interesting new mode by far is the 640x480x16 (Dammit, Jim, 16 BITS, not
>16 COLORS!) which is actually superior to any standard VGA or SVGA mode.
>(Hmmm, I'm not sure what the new "VGA HiColor" cards do. I know they
>do 32K colors, but I'm not sure of details. Anyway.)

Dammit Dave, it's INTERLACED (except perhaps on a MultiSync, in which case it
really would slow the computer down).

640x480x16bit PAL(interlaced) = 640x240x16bit VGA

... as far as slow down is concerned (since interlaced is effectively 30Hz).

640x480x16bit PAL(interlaced) is USELESS, except for title screens, which
are non-essential.

16 bitplane modes are great for some things, but seriously, 256 colours
is heaps for games (you know this Dave, you've got a PC - almost all games
use 320x240x256colours).

GF> 7? Any sign of Windows NT?). As for Atari lying, I think that's
GF> a bit harsh. I don't think Atari was deliberatly trying to
GF> decieve people.

I do seem to remember an RTC transcript from GEnie (or something) in Z-Net about a year ago, when Sam Tramiel said that FSM was ready for shipping, and that they were just waiting for the designer packaging. I don't keep old issues of Z-Net (or was it STR?) so I cannot check this, but this is what I remember.

MW> Well let me tell you something, the FALCON is an excellent
MW> machine, and does not have a 16 bit bus as you said, it has
MW> a full 32 bit bus. The machine if you wait is having a re-design.

Nonsense. See my previous post. The redesign has been officially denied by
Atari Benelux.

MW> The casing is being completely re-designed. Wait for the end
MW> of January, you shall see that I am right.

More likely the oppposite.

MW> The FALCON has loads of excellent reasons for buying it.

[lots of stuff deleted]

MW> 9.A 386SX processor can be directly plugged in enabling emulation
MW> of a SuperVGA IBM PC compatible with no trouble at all. 10.It

This too is nonsense. The expansion port in the Falcon is an A24/D16 bus,
and you can most certainly NOT plug a 386SX in directly. You need a AT
Speed-like adapter board to do it.

[more evangelizing deleted]

MW> Buy one as soon as possible, support the FALCON.

Trying to convince people that the Falcon is a good computer is one thing,
but resorting to telling outright lies about the Falcon's capabilities is
extremely counterproductive. Atari is just a computer company, not a
religion.

> ......

The TT does _not_ have composite (NTSC) video or RF outputs. (This is one of the few things I dislike about my TT.) You would need an RGB-to-NTSC converter. My Atari dealer says that the old Video Key will not work with the TT, or at least not in the TT resolutions (which provide VGA-quality graphics). JRI is supposed to be working on a genlock board for the TT, which will do the conversion.

I don't think that the Mega STe has NTSC or RF outputs, either (at least not the one I looked at).

>They DO NOT "want games written for" the 640x480x16bit mode [note the
>unambiguous "bit" addition]. Why would they? non-VGA, interlaced?

Just telling you what they told me when I was out there, Warwick.

>Somehow, it seems Dave just wants to slam Atari.

I have no reason, and never have had any reason, to say anything to
slam Atari. They've been generating their own bad press quite well
on their own.

If people seem to be deluded, I may feel obliged to correct
misconceptions since I've been "on the inside." It's simply not true
that I've been posting criticisms of Atari because I want to slam
them. By assuming that, you're attributing an awful lot of nastiness
to me. I'm not nasty -- stubborn perhaps, but not nasty.

>The modes appropriate for games are:
>
> 320x240x256col 75K
> 320x240x65536bit 150K
> 640x240x256col 150K, maybe (not 1:1 aspect ratio)
> 640x240x65536bit 300K, maybe (not 1:1 aspect ratio)

Your expertise with game development notwithstanding, this is only
your opinion. The fact that you do indeed have some clue about what
you're talking about probably means you're not arriving at the same
conclusions as the game development people at Atari HQ. (See my
previous post "Re: Hello, GW").

They rightly realized that the only modes unavailable on other machines
were the 64K color modes. The Atari game development people therefore
saw these modes as their best bet. I've already mentioned that I pointed
out at least one significant technical problem with using 640x480x64K
as a game mode (RAM), and Howard has now explained another in enough
detail for even ingnorant bastards like me to understand. :-P

What I haven't even mentioned yet is that they informed me that they
NOT ONLY wanted to run in that mode; they wanted to run in that mode
with overscan.

>No games will exist for that mode.

Perhaps if you try to tell them this you will get a better response
than I did.

>Maybe an optional title-screen, nothing more (just like on the Amigas -
>no-one minds an interlaced, HAM title screen, but TO PLAY ON???
>doubtful, Dave).

Damn right it's doubtful. You're in violent agreement with me. (Just
not with Atari.)

Again, you're not arguing with me; I was only giving Atari's "wishes"
with regard to Falcon games. (And we certainly did hear a lot of
wishes.)

I think the 64K color modes are interesting, but not very useful for
anything but still images.

6890. NN Newsreader Installation -- Help!?!

Newsgroup: comp.sys.atari.st
Date: 1992-12-10 06:23:38 UTC
From: mforget@elfhaven.ersys.edmonton.ab.ca
Message-ID: <H.FnXttfyi6xA@elfhaven.ersys.edmonton.ab.ca>
Source record: 213309

Hi!

I just got a copy of the NN Newsreader (6.4.x.x 1.3) and I need some help installing it.

I am currently using Hermes 1.00 to get my news and mail, and GUS to read it. My directory structure is the one recommended in the Hermes documentation (at least I think it was):

E:\BIN\ Hermes binary files.
E:\ETC\ Hermes support files. (CONFIG.SYS, XHOSTS, PASSWD, Etc.)
E:\DOCS\ Hermes documentation.
E:\USR\BIN\ Mupfel/Hush command line interpreters.
E:\USR\LIB\MAIL Mail routings (not really used on my system).
E:\USR\LIB\NEWS Active file, SYS file.
E:\USR\ADM\ Hermes administration files.
E:\USR\SPOOL\NEWS Where the articles for the newsgroups are stored.
E:\USR\SPOOL\MQUEUE Outgoing news/mail.

The NN folder structure looked the same. The NN binary files were in USR\BIN\ so that is where I put them on my system. There were also other binary files in BIN\ (UNSHAR.TTP, SED.TTP, GREP.TTP, Etc.) which I moved to my BIN\ folder. There was a folder called NN in \USR\LIB so I moved that folder to my own \USR\LIB\ folder.

From here on, things stopped going well. For lack of other ideas, the first thing I did was type "nn.ttp". The system responded with something along the lines of:

"Can't open e:\usr\spool\news\.nn\MASTER Mode 0x280 Errno=2"

I created the .nn folder (what kind of a name is that?!) and tried again. I got the same result. From there, I tried to run NNADMIN and got the same response.

Can anyone tell me what I am doing wrong? NN looks like a great newsreader to use. I also noticed that no mention is ever made of Hermes. Can I even use NN with Hermes? As I mentioned, the version I have is NN 6.4.x.x 3.1 ST.

Any help would be appreciated. (Hermes UUCP is great, and if I ever get some money, I'll be registering it so that I can get the newer version.)

In dire need of help,

Hmm.. "Michael Smith" (I think that must be his name) blathers about PCs..

Sheesh.. get a clue and join the "real world", Michael..

PC motherboards are ALL standard.. they ALL have their holes in the same places.. they ALL have their slots in the same places.

Geesh.. make me go into my Flash buffer to find more blather..

8bit cards will work just fine with upgraded motherboards.. maybe not as fast as more expensive 16 bit cards, but they WILL work..

"Mauling" metalwork (or plastic, actually) seems to be more related to "upgrading" STs than PCs.. the openings in PC cases are all standardized.. not so with Atari stuff.

I dunno why I'd want to put a "real" AT sized motherboard in my XT case, when there are "zillions" of "mini '386" motherboards that will fit.. I guess you just don't have the background to understand to make it worthwhile explaining THAT to you..

Guess what, Michael.. for $65, I not only got a nice "mini tower" case with digital speed readout, but also a 220 Watt power supply... do you think Howard's claims will invalidate a 220 Watt supply..?

Maybe someday when they have time, the girls in the Terminals department where I work will have time to explain things to you..

This information has been kicking around on my system HD for ages, but this club does exist! A friend of mine sent the guy some money and did get some real nice stuff more STOS. Mainly quite a few enhancments for STE users. There was Sound Tracker support files, you know those Amiga MOD files. Scrolling routines for mapped games...

The guy was in a major accident so he was out of the picture for quite some time, but he is back now. Drop him a line.

Here's the data...

There are some major changes for STOS Canada Club members where you can get 100 new commands added to STOS for your pleasure including 6 joystick port routines, Stereo sound commands, and much much more. If you are interested you can join Stos Canada for $25 a year Issue Six has just been sent out with source to the Big Stos Demo. We provide new 1991 subscribers with the new STOS commands and if you wish to join send and money order or cheque to STOS CANADA CLUB
P.O. Box 2083, Station B
Kitchener, Ontario
N2H 6K8

Hope that helps anyone programming in STOS as we have a 200 disc Library of files available to Club Members. A STOS sig and extra STOS programs are available via the Super BBS (519) 749-1206.
Only 250 Megs now but we are getting an optical drive soon

Dave Tomesch

~ QNet 2.04: NaNet *System EX-10 Canada* Kitchener Ont (519) 725-4400

Well after a complete rewrite of the original program that I wrote nearly two years ago, JM's Learn to read Hiragana & Katakana game is ready. Yes could you believe that I actually had the program written then by accident I wiped it out. It was more than a year before I finally re-wrote the program. Now it is better than ever, with large easy to read basic Japanese characters. This program is coded in STOS, and seems to work on most ST's. I might rewrite it in GFA basic latter. The program is shareware and I hope to get it on the Atari.archive soon.

If there are any questions please forward them to my E-mail Address:

jmtech@gorn.echo.com or jmtech@deeptht.armory.com

>First of all, it is black and white. The software companies own the
>rights to the software and can sell at any price they like. You either
>pay for it or you are stealing it from them.

Legally speaking, this is absolutely correct, of course. But this finding doesn't help to resolve the vicious circle described above. Strict enforcement of the relevant laws would give software companies a boost in profit, but at the same time, it would stifle the creativity of the computer community, and destroy its culture. Therefore, it would actually be harmful for the companies themselves in the long run, as it would lead, among other things, to a shrinking of the size of the installed user base.
Unfortunately, the laws that are supposed to organize the software market have given rise to the vicious circle, and they don't offer any way to get out of it. Therefore, it is necessary to develop new concepts for software distribution.

>What you seem to be suggesting is that if the software wasn't that
>good, or if you felt you were overcharged for it, then it is okay

Right. However, the fact that one part does something wrong implies by no means that the other part is doing something right. What I'm saying is that two wrongs make a vicious circle, which is, of course, by no means a right. In this situation, blaming either side for their wrongs doesn't get you anywhere. The way to get out of the vicious circle is that all who are caught in it cooperate to get out, and blaming each other is certainly not a good way to foster a spirit of cooperation.

Yep, totally agree, also an increase in profits SHOULD result in
a lowering of price - competition, market forces etc. so you'd be
doing yourself a favour by increasing the companies profits. Or
maybe the companies would pay the programmers more... Nah, maybe not,
not if they already work well enough for what they get.
How about singling out the companies you like and only informing them of
pirated software? Even more consumer control!
Somehow though, unless the victim (of your wrath :-) is a large company,
it won't be worth the software company's while to prosecute - consumer relations
etc., big bad company against poor little individual - cost shouldn't
matter much - being a criminal action it should be covered by the state.

On my UNIX-machine there is a program called "lha", try this
instead of "lharc".

The actual study compared the "quality" (A very subjective thing) of
student writing given that one group of students used MS-DOS word
processors (NOT MS-Windows) and the other group used Macs.

This discussion really belongs elsewhere but if anybody is interested
I can dig up a reference to the actual article that this was said in.

I'll just say here that there were serious problems with that study
that make the results very questionable. Even the author of the study
admitted that & decided to continue looking into it.

I've gotten a number of responses like this, and folks, you're missing the point. There has been no damage done to the files that give tos error 35, they just suddenly stopped working when I added more memory. The stupid floppies were in a box in another room when I soldered the memory in, so the files haven't been corrupted! You could almost convince me that subtle memory flakies are causing the load image to be corrupted at load time, but I have trouble buying that since so many programs work correctly, and I assume that, for a given machine with a given set of accessories loaded, all "transient" (to borrow a term from CPM days) programs load at the same address.

Someone suggested I try a program called "make512.tos" that attempts to solve this problem, but it doesn't seem to be on umich.

HELP! Does anyone have make512.tos that they can send me or upload to umich, or even tell me where on Earth I can ftp it from?

Thanks again,

Bill Dudley
AT&T Bell Labs
dud@hocpa.ho.att.com

P.S. the FAQ's information on this point is nearly worthless, to whit:

' Invalid program load format....-66.....35

The last code is the infamous "TOS error 35"! '

One wonders why it is so infamous if it is due to corrupted executable files. Surely there can't be so much damage to files in the Atari world?

dud

Okay, so I undrstand the concept behind real-time compression...sort of! I've seen some of the IBM programs...from afar! Anyone know the dope on these programs? Do they really do what they claim...effectively? What is the uncompression delay like on an 8Mhz machine like an old ST? What kinds of files benefit most from the compression (I assume it can't compress all equally)? Does it just compress data files as they are saved/written or does it compress ALL files on disk? I realize these may be old hat to many ST'ers but they are questions I have always had about these kinds of programs...so maybe others have also. Reply if necessary, but posting may be more beneficial. Thanks muchly in advance :^)

Hey Bob,

In the past you've contributed quite a bit to this group with your experience and insight into the Atari community. However most of your recent posts have been scornful and devoid of any useful information. Would you please refrain from your recent trend of sneering at anyone in the group who shows signs of optimism for Atari and return to the quality of your previous, informative posts? I'm all for lively and informative debates, but when it breaks down into a whining contest the group is not well served.

Please, Bob, I don't want to add you to my kill file and miss your occasional informative posts.

Thanks.

Source record: 213374

Well, although I probably won't use it (I just love to work out those interrupts myself ;-), it's the kind of program I would have loved to get my hands on when I started programming. So you got a yes vote here too, on behalf of all the potential future programmers who want to learn.

I've just caught up on all the fighting that has been going around. There was a lot of talk about how rotten most people are the they never pay the shareware fees, and don't even give any feedback on the program. But those who said that are the same ones who never gave ME any feedback from my first shareware game : wargame. And there are a lot. No, I don't expect a fee or anything. I put it on shareware (in contrast to freeware) because freeware gets viewed as low quality software, no matter what it is, just because it happens to be marked as free, and many would think "If it's free, it can't be any good". What I *really* wanted was people telling me how good (Or bad) the thing is, whether it works on a TT, etc ...
And what do I get ? Zip.

I understand that Dave is getting tired of this. He wrote so much stuff, and probably got no more than 1 or maybe 2 acknoledgement that his work got even looked at ! Hardly anything to go for !
The only time he got any word for blox was now, when everyone told him why it didn't have as much success as Llamatron. Maybe, just maybe, it would have made a difference if he would have been told that earlier. It would have given him an idea of what atarians like, and he could have come up with a hit, and DC would not have had to close doors.

Atari Corp may be screwing up the Falcon, just like it did the TT, but does that mean we atarians have to screw up the ST too ? Fine, we may not have all the software other platforms have. But whose fault is it? We all agree that we cannot count on the Tramiels to make it better, so it's up to us.

If the good programmers around got some incentive, we could have the best software library available. The ST is a pretty good machine, even if it's some 7 years old. Just look at those many megs large programs for IBM that do less than than the 300K one we can have for the ST. Even a game as simple as tetris costs a fortune on IBM. Mine is 70K large with some stuff added that you will not see anywhere else (I thought of putting it on a.a, but why? I probably would hear as much from it as for wargame). What did it cost me ? one week's work along with school assignments. Maybe 20 hours or so. Can other platforms say they are as easy to program as that !?!

Sure, we all have a lot of things to do (university for most of us, right?). But I'll tell you what : next term, my course load will be a lot lighter than it was those last few month. That means I'll try to start a "programming guide". GEM, GEMDOS, MFP, etc ... Something like the "proGEM" series for those

of you who saw them. Anyone interested to help me out on this, or is the atari community forever dead ?

Patrick.

From: rossin@hpfcso.FC.HP.COM
Message-ID: <7340111@hpfcso.FC.HP.COM>
Source record: 213394

You should check out 3D animations in "true color" on an HP workstation with a CRX48Z head. This graphics accelerator has 48 image planes so you can do 24-bit color double buffered. It looks damn nice compared to 12-12 double buffered (24 image plane) system. All those great looking animations are using as many bits as they can get their hands on (The Lawn Mower Man).

People have done studies that show that the human eye can detect about 8-bits of resolution per color. This is why most of the RAMDACs that you can buy have 8-bits per color out of their look up tables. Therefore with 24-bits per buffer, you can store in the frame buffer all the resolution that most eyes can detect. The Falcon will only support at most 6-bits per color (5 of red 6 of green and 5 of blue for example). To say that 256 colors is enough is like saying 8-bit audio is enough. This digital thing is an approximation to a continuous signal. You can always wish for more bits of resolution.

If you are looking into DTP the ONLY suggestion I have is that you get CALAMUS 1.09N. It is a phenominal package for ANY system. It rivals any b/w DTP program on Mac/IBM. From 1.09N you can upgrade for $210 to the new CALAMUS SL DTP program which has FULL color seperation as well as a modular design. I use both programs dutifully. I use 1.09N when I need something done in two minutes. WHen I have more time I use SL.

Pagestream is just TOO slow. I have that too. Best DTP, Calamus - hands down.

But if you are looking to spend a little more, I would suggest a 16Mhz accelerator. Any program will signifigantly speed up.

Mark Santora

6920. MegaSTe - any interest?

Source record: 213380

While I'm awaiting arrival of my Falcon (like everyone else) it came to me that now might be a good time to clear out some room for it. As such, I'm curious to find if there is anyone interested in buying my MegaSTe. It's a 4Mb unit with DSDD, 50Mb internal hard drive, TOS 2.05 and all the other MSTE goodies. It would be available with or without monitor (mono or color) and an external SF314 DSDD. No price quotes just yet, but it would be cheap, of course. :)

Hate to give it up as in many ways, it's a lot better development machine than the Falcon will be but...

If you think you might be interested, email me for more info. Thanx!

Maybe a good way to break the catch 22 cycle is for people to stop stealing software. Personally, I think theft is rather black and white. If I steal something, I can make excuses, but it doesn't change the fact that I stole something. The people I see stealing pc software are usually honest enough to admit that their motive is greed, not some lofty aspiration to make the world a better place :-)

Blockout
Algebra and Biology tuturials
Loom
Ultima II and III
Silent Service
all but one STart disc since Spring 1987
misc other magazine discs
nearly 80 Public domain discs
plus other I can't remember right now

Plus misc books, manuals, notebooks with articles from STart and other
mags,
cables, etc.

No, I didn't forget to mention a printer. I've a Panasonic 1124. Its
rather new (about 6 months) and I haven't decide whether or not to sell it.

I figure this represents over $3000 ($3500 if you count the printer) worth
of stuff if bought new. My wife says to sell it because she needs the
room and I don't have the time to enjoy it anymore (never had this problem
before we were married). Everything works great (except one old mouse).
I'm not looking to make a killing so make an offer. I'd prefer to sell the

system as a system rather than in pieces however don't let that stop you. I can deliver system to almost anywhere in the N.Va, Md, DC area and help set system up. I've still most, not all, of the original boxes.

Again, make a deal. Its the holiday season and the system is great for kids and adults alike.

Source record: 213383

This seems to be a popular subject here. I haven't bothered to read
all the posts, but one really bothered me. David Bagget said that if writers
and musicians weren't paid for their work, they simply wouldn't do it. No
great literature or music would be produced. Well, lets look at some
conctrete examples: Kathy Acker had one of her short stories killed by the
hack Harold Robbins. De La Soul had a song censored by the Hermits.
Negativeland lost their record contract and could lose everything they
personaly own thanks to Atlantic records. CSRG and BSDI may be shut down by
AT&T's lawyers.
Kathy Acker does teach, but the University system wouldn't have given
her the time of day until she was able to support herself writing. How is it
she spent years doing something she loved without getting paid? How is it
that hundreds of poetry magazines run at a loss, yet people still submit work
to be paid only with a copy of the magazine? If you love something you are
compelled to do it in spite of the cost.

I'm stunned. I had always kinda figured that Atari was run by incompetents, but I'd never dreamt that anybody in a company floundering so badly could be so arrogant. Atari's reaction to _any_ software for the ST should be enthusiastic encouragement, much less something as powerful and complete as GW. And to belittle it so quickly and easily shows not only a company that's economically sick, but a company that doesn't understand its market, its product or its audience.
Man, if Atari reacted that way to me, I'd not only program for the PC, but consider going back to Sunnyvale with a gun.

I am co-chairman of the "PTF Education Committee" (PTF is
Parent-Teacher-Fellowship) for a private, non-profit, Christian elementary/
middle school in Cedar Rapids, Iowa. We have two known-to-be-working Apples
and one IBM PC. We also have an Apple that I have not looked at yet. The
school's name is Isaac Newton Christian Academy. Money is tight, and
the roof needs repair, so usually fund raising tends to be directed towards
things other than computers. :-(

We are, right now, working on establishing a "Computer Lab", and have
been talking about soliciting donations.

We ask that if you have ANY Apple, Atari ST, Amiga or MS-DOS
hardware/ software items, partial systems, or complete systems, you
would SERIOUSLY consider donating these to our school. Even if it is an
item that needs repair, we'd be happy to accept it IF we know the
repair costs involved before it is
shipped to us.

You'd definitly get a receipt for tax purposes!

REMEMBER... this is a BONA FIDE non-profit organization!

Thank you for your consideration and support,

Bruce Rothwell

IF you rush home today, and fill out and return that junk mail!

But now that you're here...

I'm a heck-I-know-nothin-bout-atariST's-yet kinda guy.

I'm considering buying one used from someone here on the net, and I
need a couple of answers...

1. Is Lemmings out for the Atari ST?
2. What's the difference between a 520 and a 1040?
3. Is there a "catalog" of software that's available
for the ST somewhere on the net?
4. Where is the best place to buy software by mail
(I prefer 800 numbers)?
5. Is there a FAQ that recommends the best software for
various applications?

Thanks,

Source record: 213390

I have a question that someone in netland should be able to answer.
Is SDS (Software Development Systems) still doing business? Have they
moved perhaps?

I sent a money order along with the original DeskJet Utilities Pak disk
to SDS last May in order to upgrade to the Printer Utilities Pak. After
several months of no response, and a couple unanswered phone calls to
Scott Sanders, I finally sent a letter. It was answered by Scott, very
politely informing me that the finishing touches were just being applied
to the software and that it would ship soon. In September, a card was
mailed to me from SDS stating the software would arrive by the first
week of October.

The third week of Oct. went by without the long awaited arrival, so I
once again phoned the number on the card, and was assured by the SDS
rep. that if I received the card, then I was in the database and would
soon see the software. November came and went. I mailed another letter
to Scott... no response.

December... two tries at phoning the number that used to work in Oct. and
I just get a computerized voice message that "The number is no longer in
service"!!

Anyone know what gives??? I would truly like to get this upgrade for all
the wonderful things I could do with my DeskJet!

Sittin' in the dark in beautiful Canada,
Bruce.... :-)

There is no comparison between Quick ST 2 and WARP 9.....

You should have no trouble running The Chameleon. BUT, for best results w/ THE Chameleon, return to the same status you were when you loaded an ACC before you UNload the ACC.

Obviously there will remain a few diehards, but if you take away the ability for someone to make a living doing something, they'll stop doing it (full time at least). This is just so amazingly obvious I can't believe I have to keep pointing it out.

You want food? You need money. You do something that doesn't make any money? You don't get food. Unless you either support yourself on something else (thereby relgating your "real" work to a mere hobby), or you get money from someone else to live off of. (As is typical of the programmers who write free software.)

>Well, lets look at some conctrete examples: Kathy Acker had one of

You're confusing "being able to sue people left and right for copyright infringement" with "being able to make money off what you're doing." I'm not saying I like the fact that giant companies can intimidate (or send into debt) smaller companies or individuals becuase court costs are so high. I don't like that at all. If you'd read some of my other postings you'd know that I've been personally threatened for copyright infringement by a behemoth. (I didn't like it.)

I think the copyright and patent laws need to be revised so that do what they were originally intended to do: protect the *small businessman* from having his work stolen by giant behemoths. Patents shouldn't cost $20,000 to get.

> Kathy Acker does teach, but the University system wouldn't have given
>her the time of day until she was able to support herself writing. How is it
>she spent years doing something she loved without getting paid?

I don't know, why don't you ask her, and then tell us? It probably wasn't a very pleasant existance if the the struggling authors I know are any indication. There will always be people who will put up with just about anything to continue writing, hacking, painting, etc. but it is far from obvious that such people are 1) in the majority, 2) the

best people in their fields, or 3) enough to sustain and industry.

If you changed the software industry overnight and lost the William Shakespeare of applications programming, would that be all right? Do you really think ol' Bill would have written for the theatre if he couldn't have supported himself on it? You may not be talking about losing *everyone*, but to think that the only great artists are the most dedicated ones is naive. You don't know the personal lives of all the great programmers out there -- how do you know which of them could stick it out in a profitless field?

>How is it that hundreds of poetry magazines run at a loss, yet people
>still submit work to be paid only with a copy of the magazine?

Mainly becuase there's no choice, frankly. How many people actually think they can make a living writing poetry? Hopefully none, otherwise they need to do a serious reality check.

Don't try to tell me what an author's life is like; I know very well what it's like from personal experience. My mother's an author and it's the shittiest business I've ever encountered. The only way you can do something like freelance writing full time is if you have someone to support you. (Fortunately we could get along on my father's salary alone until, after 15 years, she started running a positive cashflow.) This is not a matter of quality; she's one of the best in her business (won book of the year in the baking category at the IACP convention for the International Chocolate Cookbook -- buy one) -- it's just a really tough business to survive in.

Sure, there will be people who stick it out. But only if they have someone else helping with the bills. (Like a university or spouse.) You cannot assume that this will be possible for everyone. (It's not for me, I'll tell you that.)

>If you love something you are compelled to do it in spite of the cost.

I got news for you: I've been writing software for years. I love doing it. I can't even count the number of times I've hacked compulsively for 24 or 48 hour periods without a break. But if you think I can continue doing it for free when I have $18,000 tuition bills to pay (and if it's not me it'll be my kids, right?), you're *totally* unrealistic.

>32 bit bus. The machine if you wait is having a re-design. The casing is
Ahh, but the standard memory is not 32-bit. If 3rd party 32-bit memory upgrades using the 68882 socket can be made then you are right, but I have not been convinced than this is possible.

>January, you shall see that I am right.

Do you mean a one-piece or two-piece casing (or are you talking about the Falcon040).

>
>The FALCON has loads of excellent reasons for buying it.
>
> 1. It has an excellent graphics capability.

It would need a 960x480 graphics mode to be called excellent. You can not get anything like this (overscan cannot be used in non-interlaced modes and therefore doesn't help).

I agree with points 2-9.
> 10. It has a DSP chip inside running in parallel which will enable sound and image processing to be done directly

Yes.

> with input from the DSP port at the rear. Also this chip could be used to perform breath taking 3D graphics,

No. The DSP is not really suitable for 3D graphics because they involve the processing of large amounts of data and the DSP has only 48K data memory and a very slow (1MB/s) link with main memory.

> with raytracing and shading done to produce the best graphics in TRUE colour at a speed unknown to any other
> home computer. As the DSP chip runs at an astonishing 16
Raytracing is a better example of a DSP application.

MIPs in speed. Combine the two processors, running
> in parallel and you have an amazing speed possible for all aplications where mathematics, graphics or shear
> speed are needed in processing.

Again, the DSP is not so useful for general processing because of it's limited memory.

>
>Buy one as soon as possible, support the FALCON.

I think a lot of people are trying to buy one as soon as possible, but are finding they are not available yet (Have you been able to buy one?).

>there will be any more updates, since I read an ad for a
>commercial virus killer called toXis, written by Henrik Alt, in
>the november issue of the German mag ST magazin.

The last version of Sagrotan (sometimes called Sakrotan, too) is the
very old 4.17. There will be no newer version of this slow
viruskiller. The product name has changed to 'ToXis' and it's commercial
now.

Try to use other viruskillers:

Poison (newest: 2.0, commercial)
Virendetektor 3.1g (Shareware, good Support!)
AVK 5.6 (commercial)

>Greetinx, Jan

There is a new virus included in some demos distributed in the MausNet.
It sometimes renames *all* the Files of a partition to 'ARSCHnnn.xxx'!
(Arsch is German and means ass :-( ). No viruskiller is able to detect
this virus, because the programmer of the demo included it!

Be careful!

(Sorry I don't know the name of the program(s), I'm not in MausNet)

Geeze Bob, what's with all this baiting anyway?

In article <71396@cup.portal.com> Bob_BobR_Retelle@cup.portal.com writes:
>Hi Warwick..! So.. you were there at Atari when they talked
>about what resolutions they wanted games written for..??

The Falcon doc book says (page 7, Game/Entertainment Software Guidelines)
to expect 640x480x256 color mode as the most commonly used video resolution.
(The entire manual is copyright 1992 by Atari Corporation, otherwise I would
have reproduced the entire page here.) They also say to make the games
launchable from any resolution, and to return the user to the same desktop
mode as they left on program exit, etc. etc.

My personal favorite tho - make the games installable on harddisk. I'll be
really peeved at any game that ignores this one...

Jonathan Whitcomb writes:

>Would you please refrain from your recent trend of sneering at anyone in
>the group who shows signs of optimism for Atari and return to the
>quality of your previous, informative posts?

Sorry, Jonathan, but I don't see where telling someone that they
must be screwed up because THEY don't have a copy of FSM GDOS,
and YOU do (omitting the part about having to buy an expensive
third-party program to get it) is "showing optimism for Atari"..

Nor does telling anyone they somehow owe it to us and Atari to
remain in the Atari marketplace and starve show any kind of
"optimism for Atari"..

Spreading misinformation about other computer makes might give
a false sense of "optimism", and indeed, it might not be
especially hurtful, but I normally don't feel particularly good
about building up esteem for my computer by lying about someone
else's...

As for "optimism for Atari", you might have noted that I've had
very little to say about the Falcon one way or the other, except
that I don't have one, and see no immediate prospect of being
able to buy one. It doesn't matter to me whether it has a
16 bit bus or 32 bit bus, as long as Atari gets it onto the
market, MARKETs it, and actively encourages development of
software for it.

It almost seems that topics of discussion have wandered pretty
widely to fill in the vacuum of real Falcon information.
Until we can actually get them and work with them, most of what
can be said about Falcons is purely theoretical.

It sure would be great if we had something concrete to
talk about..

>If composers/music writers etc. Didn't do anything without pay, then
>why are the music's of Bach, Mozart, Schubert, etc. etc. Around?!

Because they got paid to write music? Read even a 5 page leaflet on music history; these guys spent their lives grubbing for sponsors and brown-nosing every baron in Europe.

>Much, if not all of such music was written because people enjoyed
>doing it.

Virtually all their major works were comissioned. Bach was employed by various churches to write music for the services. Since you obviously haven't read any music history, I'll use an example from a popular film: did you see "Amadeus?" Remember that scene where the guy in the funny outfit says, "I didn't like it -- it had too many notes?" What was happening there was the *SPONSOR* was bitching about the work done. (And was also totally clueless about the work he comissioned; I see more and more parallels between music and software every day. But I digress.)

>Many people enjoy programming, and as such don't care much
>if they don't get any response (although it's always nice to get
>compliments 8-)

Look, I happen to be one of those people that enjoy programing -- what is this, some kind of holier-than-thou attitude you've got? You enjoy programming MORE than I do? You're MORE NOBLE about it?

Gee whiz. If you DON'T CARE as much as I do about response, perhaps you just haven't put enough hours of programming in, had enough of your software ignored, gotten enough "if you add this custom feature which will surely only take about 40 hours of work, I'll send in the $10 registration instead of buying a sandwhich today" letters, made enough long-distance "technical support" calls to people who never sent you any compensation, etc., or for that matter, gotten your ass flamed off for even DARING to criticize an Atari machine in this newsgroup enough times to START CARING.

"This is REALLY starting to annoy me." -- Rudy

Dave Baggett

Major thanks, however, to the 150+ people who sent me supportive email over the last week or so. And not one emailed flame -- I'm really impressed! (I hope answering them all didn't give me carpal tunnel syndrome...) :)

6948. Hi!

Newsgroup: comp.sys.atari.st
Date: 1992-12-11 03:08:08 UTC
From: S112397@UMRVMA.umr.edu
Message-ID: <1992Dec11.034027.3190@umr.edu>
Source record: 213263

Hi! I'm new to this group(well, almost new) and was wondering if someone could help me with a few problems.
1.) I've had my 520STfm for a lonnnnng time now, about a year or two ago my disk drive quit(it was the original sigle-sidedand everything) I went to the Atari serviceman where I lived at the time to get it fixed. He gave me the choice of replacing the drive with a single-sided or double-sided drive, I (being a young-not even out of high-school-person who did not have much money at all) choose the single-sided drive. After he got it into the store he *found* out that he couldn't get sinlge-sided drives anymore and gave me a double-sided instead, also (quite nicely, I thought at the time) he only charged for a single-sided drive. But after I got my computer back, I discovered the drive would not work the way it was suppose to work. Unfortunatly, I allowed myself to forget about that, as my family was moving to Missouri. Now I've called up the friendly people(they seem to be friendly) at Toad Computers and they said I needed yet anouther disc drive as this one does not have a ?Media-change? line.
My question is(you're waiting for it right?) is there a less expensive alternitive? These are the sypmtoms: Will not recognize disc changesfor double sided discs, *Will* sometime automaticly recognize single-sided disc changes(if it doesn't it does the same thing it does for double sided discs, i.e. it shows the old directory), if a show info is done on the disk after the change the correct info is displayed *AND* the directory is updated when I press ESC. I have no idea on what type(or how to find out) of TOS I have. I have done no modifications to the computer (other than the drives).
My second question is are the majority of Atari sevicemen this, shall we say, competent(sp?)?
My third question isdoes anyone know how good those nice people at Toad are(i.e. if I send it to them, is it likely it will come back working?), I'm sorry if this sounds like a derogatory question, but I've been bitten twice and $100+ is alot to spend on a computer that has cost me $700+ so far(and judgingfrom the ads in here I wouldn't even be able to get a fourth of what I've paid for it).

Thanks
Sam Groves S112397@UMRVMA.UMR.EDU (I thinkthis is my E-Mail address)

Hi! It's me Sam the Long-Winded. This time I'll make it short.
1.) Any one ever finish these games?
Time Bandit, Universe II, Sundog(without cheating), or Chaos Strikes
Back.
2.) If you have would you be kind enough to tell me any hints or where
to find hints (I'm kinda shaky on FTPing(Never done it yet) so if
you can help me out I'd appreciate it.
3.) When I fix my computer, I'm planing on buying a cheap(<$200) printer
it would need to be able to do a ALT-HELP screen dump without doing
anything other than simply installing it with install printer, and
it would need to load and eject paper so I don't waste a sheet every
time I print something. Any help on this is appreciated(I almost forgot
I have a 520STfm withit's orginial setup(all but a newish disc-drive).

Thanks a million(maybe even two).

Sam Groves S112397@UMRVMA.umr.edu

Yes they have.

It's called LaTeX. I use the "Elvis" front-end module. Others use the "Emacs"
front-end module. Someone even uses FirstWord, outputting in ASCII as
the front-end module.

In <1992Dec10.171254.23031@nosc.mil> healy@nosc.mil (Mike Healy) writes:

>Maybe a good way to break the catch 22 cycle is for people to stop
>stealing software. Personally, I think theft is rather black and
>white. If I steal something, I can make excuses, but it doesn't
>change the fact that I stole something.

Theft in a traditional sense is wrong, at least if property is
distributed and organized on a fair basis. The main reason why it
is wrong is because theft means doing damage to the person that
something is stolen from. E.g. if somebody steals my bike, I'll
have to get around without it for a while, which will cost me
time, and I'll have to buy another one, which will cost me money.
However, this reason for prohibiting stealing applies in no way
to software. If someone copies my disk, I still have the
original. I neither have to spend a significant amount of time
without my program, nor do I have to spend any money for getting
another disk.
Thus far, there's no reason for anyone not pass copies of their
disks around freely. The sole reason for people not to do so is
that they would not get any money for their work if they did.
Preventing others from getting their stuff for free is the
sole way the concept of software property provides programmers
with for turning their work into money.
Now, since the concept of software property exists only to allow
programmers to make money out of their work, and not to protect
anyone against disadvantages and losses from theft, all other
concepts that provide programmers with a way to make money is at
least as appropriate as the concept of software property. I have
already mentioned that the unavoidable hampering of information
flow is a severe problem of software property. It is absurd that
a programmer writes software so people can use it, and then he
has to prevent most people from using it in order to turn it into
money.
One should be aware of the fact that the concept of property is
designed to organize the rights to use limited resources. It
won't work with stuff of which arbitrary amounts are available.
By prohibiting free copying, the availability of software is
artificially limited in order to allow the concept of software
property to work. I have serious doubts that such a kludge will
work for long.

>The people I see stealing
>pc software are usually honest enough to admit that their motive is
>greed, not some lofty aspiration to make the world a better place :-)

Most people I see selling software are honest enough to admit
exactly the same...

>

Well, I hope all of you that feel the same way is participating in
OPERATION: A.C.T. NOW.

One of the main campaigns is to send the Board of Directors listings
of what everyone feels that they are doing right and the things that
they should be improving.

Many people have been sending in their registration forms with their
lists, but there are many people that have great ideas but will
never get heard because they didn't send these ideas to the campaign
leaders.

These lists are being compiled and they will be released soon.

There are other campaigns that are being worked on as well.

If you haven't heard of OPERATION: A.C.T. NOW, you'll have to check
it out in an ST Report that is about four or five weeks old.

Source record: 213269

In a previous article, smiller@bnr.ca (Scott Miller) says:

>My previous post, about making a math coprocessor standard on the Falcon, got
>me thinking: What would I do?

If anyone CARES to throw ideas around and you can TELNET, try
logging onto the Cleveland Free-Net Atari SIG.

freenet-in-{a,b,c}.cwru.edu = hela.ins.cwru.edu = 129.22.8.38

Type "go atari" at any menu.

Then type "12" for "OPERATION: A.C.T. NOW"

A list is being compiled that will be sent to the Board of Directors
at Atari consisting of "things that people see Atari doing right" and
"things that needs improvement".

To all those that sent in registration forms and your lists of
what Atari needs to continue doing and needs to improve, etc., they
are being compiled and will be posted.

BUT IF YOU HAVE GOOD IDEAS, THIS IS THE PLACE TO DISCUSS THEM.

>
>1) Populate the math coprocessor socket from the very beginning.

How much does a math coprocessor cost anyways?

Maybe it would have just cost too much to include it.

>
>2) Bundle in a capable and bug-free 'Atari-works' package. This will give people
> something reasonable, but shouldn't inhibit big-name software houses from
> porting their stuff.

YES, but just as long as the software isn't TOO GOOD. If it is a major
competitor to other software, it will just discourage developers if
the software is sold with it.

>
>2) Make sure the Falcon040 isn't TOO far behind, with at least the capabilities
> of the TT/030. (1280x960 graphics, VME slot) In the new case, of course.

> feeling that you plan to be around for a while. Introduce it early, but
> price it initially such that it doesn't hurt the 030. (Remember the
> C64 and the VIC, Jack?) Evolve the machine. Look at what's going to be
> the price/performance leader NEXT year, not LAST year.

AND OF COURSE, make sure that the system is in a PC/tower case.

I'm also sure everyone will be wondering what happened to the Falcon030
with a Motorola 68030 at 33 MHz.

The Falcon030 (33 MHz) and Falcon040 (33 MHz +) is the next step.

The next step isn't a Falcon 8 MHz.

>
>3) Maybe, later, introduce a Falcon/030 II, with 33mhz 030 and 882, in a new
> case, if it is cost effective compared to the 040. (It might be cheaper
> to slap in a slow 68040 instead of speeding up the bus to 33Mhz)

Maybe at the SAME time.

I did not notice you stating anything about adding more DSP chips or ports.

If Atari really wants to get into multi-media, they need to really
make the machine a multi-media system.

The voice-mail system is great, but you won't be able to use a video phone
if the voice-mail system is running.

You also won't be able to run a home security or home control program
if another great DSP product is hogging the machine.

I also didn't see you mention greater EXPANSION or perhaps an easy way
to upgrade a 68030 (33 MHz) to a 68040.

>
>4) Make damn sure there is AT LEAST SOME big name software for the Falcon/030
> early in it's life. A little productivity (WordPerfect 5.1), a few games
> (Falcon 3.0, Chuck Yeager, Stunt Island) would help. If the companies are
> reluctant (because of past Atari failures) - DO THE PORT FOR THEM. Lend
> them Falcon030 experts for a while. Do what it takes to get a few big
> titles on the shelves.

UNFORTUNATELY, Atari does not have complete control over this.

Or at least not anymore.

About five years ago, Atari may have been able to go to Word Perfect and
say, "Hey, we are releasing this new system and we are planning to
launch a major advertising campaign for it so you may want to release
an updated version." AND THEY WOULD HAVE CONSIDERED IT.

Now, they know better. They know to wait and see what Atari does
(6 months) before working on new software or products.

That is another reason "OPERATION: A.C.T. NOW" was started.

So that we can maybe help PUSH the big names to make some new software
for the ST/Falcon computers. That is if we are actually serious
about buying it.

>
>5) For the software developers who have been supporting the Atari all along,
> (Like Spectrum Holobyte, with Falcon and Flight of the Intruder) - don't
> SELL them development machines - GIVE THEM A FEW!! Each program that they
> come up with will sell hundreds of machines. A BIG return on a few free
> computers. As above, support them with FREE EXPERTISE.

I can't agree with you more. Atari is in DESPERATE need of developers.

If they gave around 100 machines a way, they would be losing:

Let's say it costs them $200 to make each Falcon...

They'd lose $20,000. But this would be made up by the increased sales
due to the tons of wonderful software.

You also have to look at it this way, if you are a developer and a
company GAVE you the machine, you may feel better about developing for it,
thus creating better software.

>
>7) Atari Program Exchange (APX), via which all dealers have access to a broad
> range of *very inexpensive* software (cheap enough that nobody would bother
> to pirate it, and cheap enough that dealers can throw it in for free to
> sweeten a deal) A not-quite-free alternative to shareware, and the
> small-time developers would get a few bucks, as opposed to none. But keep
> the quality high.

Yeah, that is another good idea. THAT'S EXACTLY WHY WE SHOULD ALL
BE DISCUSSING IT ON THE CLEVELAND FREE-NET'S OPERATION ACT NOW BOARD!

If united, we can get Atari to implement these ideas.

Even if dealers charged $10 for a program, $5 for the author and
$5 for the dealer, there would still be money to be made for everyone.

Sell 5,000 of those pograms, you have $25,000. Not bad.

And worth it.

>
>8) Sell packages in North America like those I see advertised in the UK. For
> example, a 'games package' with the F030, joysticks, and a handful of
> first-rate commercial software. In large quantities, you should be able to
> do this pretty cheap, since the developers know that every copy bundled is
> one less copy to be pirated.

Yeah, and let's go as far as INCLUDING an International Software Catalog
for free!

And how about a deal for a free "ATARI" t-shirt.

And maybe, just maybe information on ATARI publications that you can
subscribe to!

I'm going to repost this on the cleveland free-net, so if anyone
wants to join the conversation there, you know where its at.

>
>9) Market the machines with 'Not just another boring PC clone', and 'you don't
> have to rip it open to give it decent sound and graphics'. Remember, Atari's
> home is the MASS MARKET. Get a 1-800 number so Mom and Pop can call for
> (where do I plug in the mouse?) support.

EXACTLY. Advertise it as "the EXCITING home computer" that is easy use!
You'll be enjoying yourself instead of stressing yourself.

>
>Ah, there I go dreaming again.

That's the only way to get something to AIM for.

>
>Oops, another one:
>
>10) Buy a Falcon030, get a Lynx for free! You make the money selling the software
> with those, remember.

Now, I kind of don't like this one, but the rest of them were pretty good.

Maybe, BUY A JAGUAR, get a LYNX. Hahahahahah.

>
>(P.S. to Atari: Give me a call if you want me to run your North American
> marketing. :-) I'll even quit my day job. It'd be fun!)
>
>I'd LOVE to see followups on this.

I WOULD TO, at the CLEVELAND FREE-NET.

The reason I'm pushing it so much over there is so that we don't
lose anyone's message and there is no expiration date on postings
(the SysOps delete them).

From: warwick@cs.uq.oz.au
Message-ID: <11406@uqcspe.cs.uq.oz.au>
Source record: 213271

dmb@xbar.ai.mit.edu (David Baggett) writes:

>IF someone WERE to add a Borland C-ish front end to GCC,
>then SURE, it would be better, provided it was done as well. But
>no one's done that yet, and that's exactly my point: These things
>take time, and they're hideously boring for techno's like the FSF
>and you and me. So for copylefted software they never get done.
>That's why copylefted software taking over the mainstream is
>a pipe dream.

There are three reasons why "wizz-bang" front-ends don't exist for GCC:

1. Wizz-bang interfaces are usually machine specific (but see 3)
2. People don't really want them (I don't use the wizz-bang
interface to CS-TeX either [though the CLI level is WONDERFUL!])
3. There is a wizz-bang interface - if you like emacs.

>To really this back in to the topic at hand: The claim that people
>will contribute enough to copylefted software (i.e., for free) so that
>such software will become competetive in the mainstream is unrealistic,
>as we have seen in the GCC case.

The fact that the contributors contribute "for free" has nothing to
do with it - the reasons above are all.

Does Dave think that people will contribute an optimising compiler
because it is more fun to write that a GUI????

As we have seen in ALL the free software examples... they all exist,
and they each represent a very LARGE contribution.

You want a GUI? Well, there's the CS-TeX gui, for example - it's not
a TIGHTTY integrated gui - yet it is an example of a non-proprietary
gui.

>If someone does as you describe, and adds easy-to-use whiz-bang front
>ends to Emacs, GCC, TeX, etc. then I won't have nearly as much ammo
>to aruge my point with, admitted. Fair?

Fair - but why bother?

Dave continues to tell us ow "typical computer user" need to be pampered
by flashy UI's... but ignores the fact that all this Free software EXISTS
and that REAL PEOPLE (Like me, himself, and 95% (?) of the others in this
group also use it... IN PREFERENCE TO COMMERICAL PRODUCTS). I switched
from a commercial highly integrated Modula-2 compiler (TDI) to a commercial,
loosely integrated, but more powerful Modula-2 compiler (FTL), to a Free,
VERY powerful C++ compiler (G++).

So the argument has really boiled down to NOT "what does the typical computer user want", but "what IS the typical computer user want".

I challenge ANYONE to show me ANY document preparation system that I would find more useful than running LaTeX. (CS-TeX in particular, as it is a VERY good implementation).

>>Myself, note this is a personal comment, find the sort of HPI's which you
>>prefer get in my way.

>Me too, generally, though I really do like Borland's source level
>debugger.

I like Borland's debugger too. But IMO, GDB is better - and I haven't even seen GDB running via emacs. [Apparently, under emacs, GDB uses the split-window facilities to give a very high-productivity UI]

>>Give me a nice clean command line and a standard set of programs and
>>arguments any day. :-)

>Ditto. But I don't think we're typical.

Ditto. Maybe we are - there's a pattern developing.

How can we argue that the "typical user" doesn't use all the powerful tools that "expert users" do... yet in the same breath say that these "typical users" need to be able to pull boards in and out of their machines, run config s/w, etc.

I am a "typical user" when it comes to, say playing GAMES - I don't need high performance games (unlike some expert game players - wow!)

I am a "typical user" when it comes to DTP work - programs like PageStream MORE than satisfy my needs... because...

I am not a "typical user" when it comes to document preparation - LaTeX is what it takes to satisfy me.

I am not a "typical user" when it comes to programming - I need a high-power C++, ie. G++ to satisfy me.

Yet, I can do all this on an ST.

I'll do it better on a Falcon.

I couldn't do it on a PCclone (no usable G++; no usable LaTeX; off-the-planet game [actually, I think they are simplistic CRAP, but I don't claim to be a games expert]; Maybe Venturer does more than PageStream? But more than CalamusSL (which I could use if necessary)?).

>"Microsoft C/C++ 7.0" :) (Well, not brilliant.)

>>Would this be a good package too?

>No, but it sure is popular!

AHA! The CRUX.

Dave is saying:

"XYZ sells well"

Others are saying:

"XYS is bad"

These are not mutually exclusive.

I think a CLOSED architecture should actually sell better to a home
market than an OPEN arch, simply because it is a tidier system. Dave
might say this is a BAD system - and maybe he'd be right - but it really
does depend on the target users.

I think Atari computers have a good balance of simplicity (closed arch)
and sophistication (PCclone programmers DREAM of a 2 megabyte expanse
of seemless memory).

The Falcon is above all previous Atari releases, indeed for what it does
for the price - it's above virtually every other computer on the market!
(Although, it itself isn't on the market yet as such)

Of course - everyone who has a different opinion (e.g. IBM & Amiga users)
(or most of the dedicated ones anyway) - will debate this 8-) (note the
smiley)

Dave actually used Atari's statement to suggest that 1 megabyte was not
sufficient for the Falcon, and he said the stared back at him blankly.

Obviously, he was talking to people who were more aware of the marketting
side of things than the game development side.

1 megabyte is not underpowered, since the usual mode will be two page-flipped
75K screens.

2 would, of course be a better minimum.

>I hope this ACT NOW thing isn't run by ST-Report, in any way. (SOmeone
>did mention it) as all ST-Report ever has to say is negative!

No, ST Report is not involved with it. The only thing they did was
post information about it in their online magazine.

The only thing I can suggest is logging on Free-Net (if you can)
and check it out. If you don't like it, don't do anything with it.

But I'll tell you right now, if you enjoy using Atari products and
wish to continue enjoying using Atari products (especially 16/32-bit
computers) then this operation is for you.

Microsoft Works is useful? Just kidding. This is just exactly the type of application that Atari needs and they have in fact made some effort to get it ready for market as Concierge (formerly Sutra). If they don't somehow manage to blow it, I think it will serve well as a marketing tool.

>Unless Atari can achieve some kind of public awareness of their products,
>they'll have to have at least SOME "big names" to attract potential
>buyers, and to give them some confidence in the line.

I'm not sure about the "big names" but if they can't at least get some dealers things will probably not go well with any of their upcoming offerings. We are very fortunate in our area to have several strong dealers of Atari products but it will take more than just a few tenuous footholds for them to make any progress in the US market. It seems to me that the era of computer as appliance is a reality right now and the Falcon should be a capable offering for such a market. If there isn't anywhere to buy one and there isn't anyone advertising them for sale, few will be sold regardless of their merit. This is an issue that Atari says they recognize and are attempting to address with their regional marketing plan. I, for one, am content to be patient for a while and see what develops since this is a time of great change for the industry as a whole. After all who would have thought they would be seeing IBM doing mail order? Or Digital Equipment advertising in the Computer Shopper? Let's see what Atari can do. I'm afraid that you are probably right and that they'll blow it, but I like mine enough to give them the benefit of the doubt.

6967. Hewlett Packard Deskjet 500C help wanted!

Newsgroup: comp.sys.atari.st
Date: 1992-12-11 07:53:18 UTC
From: jared@midiline.la.ca.us
Message-ID: <JFyLVB1w165w@midiline.la.ca.us>
Source record: 213285

As of tonight, I finally figured out why my 500C wasn't communicating very well with my MEGA ST. After it prints out a text file from the desktop (the only thing I can do, since I haven't a 500C printer driver for 1st Word, and attempting to do a screen print produces nothing but letters and graphic gobble-de-gook), it takes about 10-20 seconds to retract the head to "home". Since I wasn't waiting for it to do that, assuming I could print the next file right after the previous one was finished, the ST sent the print command, the 500C wouldn't reply (as it was busy getting ready to go "home", and the whole deal goes dead. The ST considers the printer non-existant and no way of recovery.

But now that's all been taken care of, thanks to my ever-persistant nature. What I need now is this:

Does anyone know how to write up a HP Deskjet 500 printer driver for 1st Word? (not 1st Word Plus) I'd really appreciate it. BTW, is there any way a screen print is possible between the ST and the 500C? Maybe someone could write up a program to make use of the 500C's color capacity? It's a thought... I'd sure buy it! (i.e. pay good money for it)

Reply in Email to: jared@midiline.la.ca.us

True, but that's not because of any Atari policy to keep the information secret. The doc package was on sale at the Glendale Atari Fair, and probably also being sold at any other Atari fairs since then. Now, maybe not too many folks were interested in buying docs for a computer they couldn't touch yet, but that's a separate issue...

Does somebody want to clear this FOTI confusion up? I always thought that Spectrum Holobyte screwed up by not releasing FOTI in the US at the same time as Europe, so most people bought import versions, and SH had no way to tell how many were imported. I know 3 people with FOTI (the only ones I know that have FOTI) and they all bought imports...

The 700 figure does seem low even then. But does anyone know how many they sold in Europe? Has anyone taken a poll of US dealers and distributors that sold FOTI for a sample size? Just asking.

6971. Re: Piracy of software

Newsgroup: comp.sys.atari.st
Date: 1992-12-11 09:59:38 UTC
From: jhh@cwi.nl
Message-ID: <8303@charon.cwi.nl>
Source record: 213288

This discussion really interests me, so any reactions on my point of view are appreciated. First I will confess I used and use pirated software. I will not tell you which programs though :-).

I personally believe the coin has two sides. To defend myself, first of all,
- I would never/will never buy these programs, because I think they are too expensive. This implies that if I had not obtained the illegal copies, I would have done without these programs. No problem.
- I think this is somehow equivalent to copying books when I was a student. Paying $80 for a 200 page book I only needed to pass an exam was way above my budget back then (and still is).
- I disagree to some extend with Randy, who says that software companies own the rights on their software. We must keep in mind that this software consists of many parts/many algorithms. Now some of these algorithms may have been invented by the company itself, but I suspect that most are just simple adaptions of other algorithms, which have been around for years, invented by many different individuals that might also claim ownership (I hope not...).
- As I said before, I think that software in general is too expensive. I will never buy software that costs more than $70 (including good manual). I do believe that if all software were cheaper than this, more people would buy it, if only to have a manual for a change. If enough people buy a software product, this should still give the company some profit (and I do personally believe that if a company makes a profit, it should go to the programmers, not to the bogus managers that already earn to much in the first place...).

I do realize however that in the strict sense of the word I am stealing something from someone else. And this cannot ever by wholly justified. If one really NEEDS a program, you should buy it (and I do).

I think I am more a fan of the shareware concept. I think I see programming as an art, something you do primarily for personal satisfaction. Of course, getting some money for a program you wrote is nice, but it should never be exaggerated. Let my just conclude this by saying that my guilt would be inversely proportional to the price of the software product.

I've no idea but last night I watched a TV program called Bad Influence
(I had to tape it cos it's on when I'm at work). This is a video game and
computer TV program. Anyway, they had an Amstrad computer that by sliding a
door over the disk drive revealed a cartridge slot. In this slot you plug
Sega Megadrive/Genesis cartridges! I looked at my calendar and sure enough
it wasn't the 1st of April. Wild huh?

The same program will showing the Falcon next week so if you are in the UK
tune in or tape it folks (Bad Infuence, Thursday, 16:45, ITV). I doubt if
Atari are involved with this or even any developers but we'll see.

I'm sure that with enough technical knowledge a Gameboy could be emulated.
If not on the ST then the Falcon. The DSP could maybe emulate it's processor.
I dunno.

No, the standard memory is 32 bit. Only the 68030 had 16 bit access to
memory, other parts of the Falcon have full 32 bit access.

This was dicussed at great length in atari.tech.

Get off it - ST-Report is NOT all negative. It's occasionally realistic (and to be honest, it's fairly chirpy compared to the real world). Unfortunately, a large number of people have been brainwashed by Atari's Chosen Ones (ie certain employees, a certain house magazine, and a certain online magazine that's all but a house organ) that ST-Report is run by Satan's Minions. Sheesh.

The fact that people who pirate stuff out of sheer greed
sometimes like to abuse this argument does not invalidate it.
Software is overpriced according to a lot of sensible lines of
reasoning. E.g. a good fantasy book is very comparable to a good
fantasy game, in terms of intellectual effort and time it takes
to produce them. Nonetheless, a game is typically 10 to 20 times
more expensive than a book. I think it perfectly appropriate and
justified to call this software overpricing.

>Much, if not all of such music was written because people enjoyed
>doing it. Many people enjoy programming, and as such don't care much
>if they don't get any response (although it's always nice to get
>compliments 8-)

Not to shoot at my own people, but the examples you give are not all that good. Bach, genious though he is, wrote for a living. He had to feed (lots of!) children. Many classical composers were indeed "professionals", although the work mostly wasn't appreciated enough at their lifetime (I think Rachmaninov was about the only composer who didn't die poor...)

But the point that writing programs is an art and being a programmer makes you an artist is still valid. Not that we should all go and live on a dusty attick in Paris, but it's not that strange to write programs just as a form of "self-expression" (what a word...), as you could (should?) do science just for the sake of science, not to get a well-paid job later, and write/make music just for the sake of music.

But this is getting rather off-topic. Sorry,

Sander STOks
sanders@sci.kun.nl

P.S. Don't get me wrong about Bach; I'm a great fan of his. I even have an "I [heart] BACH" T-shirt. And I'm seriously considering a ditto tattoo.

>once the Falcon is ready to ship as possible..?
>

Atari don't seem to think so... I expect we might get a few rough and ready effects, suitable for games through a TV loudspeaker, bundled with the machine. What would sell the machine is studio quality effects, which *are* possible on a 56001. Hell, a decent dedicated reverb unit costs upwards of 500 sterling.

>Gosh.. if I ran a company trying to break into the DSP
>applications market, I think I'd certainly seek out anyone who
>had experience in the market I was trying to move into..

Yes, but those people often have other commitments and only program audio stuff for fun in their spare time :-)

On another point, does anyone know what sort of data rate I can expect from the internal IDE drive - I already have a 48Meg SCSI drive which does about 550k per second on my ST, and I want to know if I should spend money on a big IDE drive, or a big SCSI drive for hard-disk recording.

>controller and a Seagate ST-125-HD. The text obn the ROM on the board reads
>SH-205 or SH-225. He also wants to know what the DIP's are for...

Before Atari renamed all the hard disks to "Megafiles", the
Megafile 20 was called SH 205. Probably Atari just forgot to rename
the labels on the ROMs. :-) The difference is not significant anyway.

The ST-125 is built in all the SH205 and Megafile 20 drives, so this
is nothing to worry about either. Only the controller has been
developed by Atari (?)

The DIPs are for changing the ACSI device identifier number. This is
only relevant if you are planning to run more than one hard disk
drive.

>
>You wouldn't need to bring a gun; you'd need only spin the barrel on
>their own.

I'm curious. I suspect (correct me if I'm wrong) that a lot of the current owners of STs have owned 8Bits in the past. (At least folks in North America. I don't know how popular 8Bits got elsewhere.) How many of us consider sticking with Atari out of some amount of loyalty to the company?

My question is: Why do we do this to ourselves? :-) We must be eternal optimists, or delight in writing all of our own software. The Atari net community does make up (somewhat) for the lack of commercial software. Of course, I'd like to play new things like Ultima Underworld. At least we got Lemmings!

(Wait for GW! It will be _the_ programmer's delight.)

He did this with the droid, didn't he? If he didn't, he must have hacked the game :-)

Seriously, has anyone ever completed (I mean played the first 100 levels) llamatron without the droid? I got to level 94 twice (each time with a warp from level 89), where you get the sheeptepede and four tanks on the border. First time I got there I was offered a triple shot immediately, which I was unable to get before I died (which was almost immediately, too). Second time, nothing special showed up, so I just died a zillion times without the slightest of a chance.

My high scores : 2.56 mil - with droid (lev 179 I think)
1.63 mil - without droid (lev 94)

Cheers, Christoph

> I have a 520STfm withit's orginial setup(all but a newish disc-drive).

There's a nifty little PD utility program called "Fast Fix" that you pop
in your AUTO folder and it turns off the key click and fixes the screen
dump so the whole screen fits on a sheet of paper. I've been using it
for a long time and it's never interfered with anything.

My old faithful Star NX-10 doesn't eject a extra sheet. I imagine most
printers can be configured to not send a form feed after printing a job,
but you may have to play with your drivers or be prepared to flick some
DIP switches.

6992. Hebrew PostScript fonts for PageStream?

Newsgroup: comp.sys.atari.st
Date: 1992-12-11 16:05:14 UTC
From: hjb@gad.th.vu.nl
Message-ID: <1992Dec11.160514.8404@cca.vu.nl>
Source record: 213315

Is there a Hebrew Font for the DTP program PageStream? I would especially be interested in a PostScript font.

If not, does anybody know how to use any other PostScript Hebrew font in PageStream? The problem would probably not be the PostScript definition, which is supposed to be uniform, but the bitmapped fonts that PageStream uses for its own screen.

Thanks,
Hendrik Jan Bosman

>
>>Overpricing according to whom? According to the people trying to rationalize
>>software theft?

Yes, but not only them.

I'll take a few quotes out of a software manual that I have here beside me. One that's decidedly not written by someone trying to rationalize software "theft".

"Most estimates put copyright violation at or about 4 illegal copies for each legal copy. Since software companies are under normal competitive market pressures, prices fall only to the point the company can stay in business and make a profit. Too many fail.

Because of illegal copying and these market forces, it turns out the honest customer ends up paying five times too much for each program he buys. Even the dishonest person who lets his four friends make a copy is paying too much....

The big software company just raises prices to make up the difference. Here's an example: a top word processor in our industry has a retail price of $495 and sells for about $295. It, like most other programs is illegally copied about 4 to 1. If every user was honestly paying for a copy, the market would force the retail price down to about $99, and it would probably sell for less than $60." - Rod Coleman, Sudden View Reference Manual.

I would disagree slightly; the price would probably be about $80, because manuals DO cost money. WordPerfect Corp. doesn't have to manufacture manuals for those copies that are currently pirated. I don't think it would be a linear price relationship as Coleman suggests.

Piracy HAS led to software over-pricing. And it IS a killer circle.

>The fact that people who pirate stuff out of sheer greed
>sometimes like to abuse this argument does not invalidate it.
>Software is overpriced according to a lot of sensible lines of
>reasoning. E.g. a good fantasy book is very comparable to a good

>fantasy game, in terms of intellectual effort and time it takes
>to produce them. Nonetheless, a game is typically 10 to 20 times
>more expensive than a book. I think it perfectly appropriate and
>justified to call this software overpricing.

On the other hand, a good fantasy game is probably going to get used a few more times than the corresponding fantasy book. The game has somewhat more utility, and will correspondingly have a higher price.

It would be more appropriate to compare the price of a good computer fantasy game to that of a good board/book based fantasy game. They're much more alike.

It may be easy to vilify Jan Kim as an "evil pirate;" some of his arguments have been a little simplistic.

For instance, his price limit of $70 might be fairly reasonable as a limit on the price of software for PERSONAL use - but it's looks quite silly when put beside the VALUE of specialized business software. There's companies out there that can charge hundreds of thousands of dollars for their software - and they're not necessarily ripping the customer off. The production of the software may have cost a lot; and the software may provide great value.

However, it IS important to note that the NATURE of software is different from that of many other "commodities."

The "theft" of software is intrinsically different from the "theft" of money.

In the case of money, the "theft" results in one person having $x, and the other person LOSING $x.

In the case of software, the "theft" does not DIRECTLY result in any economic loss. There may be a loss of POTENTIAL sales, but that IS quite different from more traditional views of theft.

There are MANY other things that are attached to the use of software that can more easily be charged for:
1) Proper documentation,
2) Q&A Hotline,
3) Technical service,
4) Customization of application,
these being only a few examples.

Piracy is a SERIOUS problem within the "Mass market", because things like 1)-4) are either unnecessary, or are easy to go around.

I would suggest that QUE Corporation, publishers of various and sundry handbooks/user guides to MANY software packages, would NOT be in business except for the presence of software piracy. People will pirate WordPerfect, and then pay $40 for a "manual" by QUE.

If you wanted an alternative way of eliminating software piracy,
eliminating the "cheap manual" industry would go a long ways towards
this. I would go so far as to suggest that these "manual publishers"
are among the most important people that aid and abet software piracy.

If you want to make sure that YOUR software product is not going to
get hit by piracy, make sure that some additional services will be
necessary. Don't go after the "mass market."

If the big IDE drive will fit inside the Falcon, go for it. My suspicion is
that SCSI will be faster and more cost effective in the long run, though. I
have yet to get a decent SCSI-2 cable going to test for myself...

My big plan now is to get an Exabyte tape drive - at 2.3 gigabytes for a low
density tape, you can record 3 76-minute CDs on one tape!

Look at the big picture kim. A company may need to invest hundreds of thousands if not millions to produce a quality program. Operating systems are among the most expensive when they are done right, and even more expensive when they are done wrong. I would say a company in this situation is probably losing a bundle if they sell the program for less than $200 a copy. And manuals aren't cheap.

Now for little utilities that took one person a year to write on their own time, mainly for fun; I agree that the software price should mainly comprise of the production cost of the manaul, disk reproduction service, and shipping and handling.

But golly kim, how do you expect someone to place their career in programming and then tell them that he or she is not allowed to eat.

And, by the way, I am a poor student with a wife and two children, so I am probably in the same financial situation you are in.

6998. Re: Jaguar, Falcon, Atari generally

Newsgroup: comp.sys.atari.st
Date: 1992-12-16 18:06:14 UTC
From: SML108@psuvm.psu.edu
Message-ID: <92351.130615SML108@psuvm.psu.edu>
Source record: 213319
Cross-posted to: alt.games.lynx,comp.sys.atari.st

Those of us that are Atari ST, Lynx, Falcon or potential Jaguar fans would be well advised to read the most recent issue of ST Report...

Double Click Software, a small company which has made some utterly fantastic software for the ST, spent $3000 of its own money to go visit Atari Headquarters to show off their product _Game Designer's Workbench_, here are some highlights but I do not do this terrifying article justice merely by describing it, read it for yourself, I beseech you as I think I have finally been convinced to abandon atari by it...

1) DC software asked atari if they had a removable hard drive so they could just bring a cartridge from their hard rive and load it there. Atari sad "Suuuuuuurrrrre", so they that's what they did. When they arrived they were first told that they didn't have any such drive but then they cobbed one together after an hour or so. After fiddling with the drive for an hour and failing to load the software the Atari Engineers proclaimed that "the cartridge was formatted with s___tty 3rd party software." As it turned out, it had worked just fine but that it had an empty C partition and all of the software was on the D partition. By the way, the s___tty 3rd party software was from ICD, a really good company...

2) Leonard Tramiel and his idiot engineer friends constantly heckled these developers during their visit with such lines as "What would be your reaction if we sued you for copyright infringement for HacMan II?" And remember, this is the guy who's now in charge of the Jaguar... Way to go Lenny Boy! Bring atari back to the top of the fortune 500 by suing all of its former developers! Genius! Master Stroke!

3) Upon showing the lynx developers the Game Designer's Workbench, they heckled it and said that it stunk because it didn't contain features for automatic sprite scaling and rotation. The DC people attempted to explain that the reason the lynx had that feature was because it was in the lynx hardware not the software and that additionally they had written such routines for GDW and could easily incorporate them, but this just got them a chorus of boos... So now we know why most recent lynx games are lame... Additionally, Atari has been trying to get the lynx developers to move to the TT, but they refuse to do so because that would mean they would lose access to their favorite text editor making them incapable of of programming. Oh the PAIN! Oh the PAIN!

3) The one shining star in this visit was Bill Rehbok. He gave DC software a Falcon for their troubles and apparently he along with the TT programmers were the only people who were polite to these people.

Well, those are some highlights. READ THIS ARTICLE! There's a lot more idiocy from the Katzenjammer kids I haven't mentioned... I have an ST, a lynx, and an atari 800. I was planning on buying a Falcon and I may still do so. After reading this article, I was ready to buy a new Amiga instead. However, all it took was an hour of articles on comp.sys.amiga.advocacy to make me realize that they have similar problems as big as Atari's. So now I'm in coast mode ready to abandon them if only some third party would come out with a computer with the best features of the Falcon (DSP), and the Amiga (Graphics), and a 32 MHz 68030... I hear Electronic Arts is working on something interesting along these lines...

Scott

d> I'll be damned if you get 4+ years of my work for free given the
d> kind of backstabbing "milk the developers for all their worth and
d> them bust 'em in the chops" attitude I've seen here lately.

This is the first real indication we (I??) have seen of the size & scale of the GW -and to be honest it saddens me a little.

Not that you have produced a lemon - quite the opposite - I fear you may have created a product vastly too large for, what I see anyway as, your market.

Most of the people I know of who have expressed interest in writing games, and who had far and away the best & most original ideas, were teenagers or in their early to mid 20's. Old enough to understand C, but not enough to have the sort of financial footing required for such a comprehensive package.

As a "highly placed" (*giggle*) 'official' in the local atari user group, I've been approached by several young (hey, my age, okay? 8) programmers who have asked about the existence of a toolset like the GW. I have told them what I knew - and listened to their ideas.

Now, I know for a fact that they wouldn't be able to afford the GW. They might not be able to produce all of the necessary glue code - but there are others like myself that they know, with zero imagination but good problem-solving skills, who could.

People like that would be a perfect target for the GW... except that they cannot afford it.

And, understandably, you couldn't afford to sell it to them for what they could pay - hence my sorrow.

Thus, I pray that some software house, one that might actually still be bothering with the atari, may licence GW from you and earn you some of what it owes you.

d> 5) You've "seen and heard how many people want to get their hands on
d> [Game Workench]." OK, do you think they're willing to pay the
d> several hundred dollars it's worth to "get their hands on it?" If
d> not, then this overwhelming demand you cite is utterly uninteresting.

Not so much willing, but capable. One guy I know of has been trying to find a platform supporting such a toolset to write his 'killer game' on. (personally I think the idea sucks, but then it's amazing what people will buy... 8) To my knowledge, he is still looking.

d> Dave Baggett

(thanks for the input)

m> progressed in the game?

What a stupid question??!! He clearly states what is continually repeated here again and again, without ever a clear answer... He cant!

The OXYD archives on a.a are broken - Oxyd itself, whilst it "works" contains _NO_ documentation on how to play, or where to get the book from, or even that you need a book. I had it online, and had about 20 downloads of it -and as many messages from people saying "how do I play", and "why is it impossible to play?".

Ditto with OXYD2.

Is is possible to play either without a manual? How? Where does one get the manual? How much (I think that is in the game somewhere...) is it?

(3:713/602) writes:

BB> Hmm.. "Michael Smith" (I think that must be his name) blathers
BB> about PCs..

Yup... wow, you can actually make something out from the headers the IXgate system adds to my somewhat more succinct message format?

BB> Sheesh.. get a clue and join the "real world", Michael..

sigh. Not a good start, Bob.

BB> PC motherboards are ALL standard.. they ALL have their holes
BB> in the same places.. they ALL have their slots in the same
BB> places.

Hah. And you ask _me_ to join the 'real world'...

Having done my time in various sweatshops assembling the useless things, I can tell you from long, painful experience that your preceeding paragraph is just so much hogwash. Show me a PC case, and a set of cards, that all fit properly, and I will point at a machine fitted with cards made by the same manufacturer, in metalwork they also designed, and which you will have paid top $$$ for. (eg a "real name" brand, like Olivetti (AT&T), Compaq, etc.)

BB> Geesh.. make me go into my Flash buffer to find more blather..
BB>
BB> 8bit cards will work just fine with upgraded motherboards..
BB> maybe not as fast as more expensive 16 bit cards, but they
BB> WILL work..

Umm. You sure? ever notice the EPROM on an 8bit XT controller card? Wonder where in the address space it fits? What it does? Where the registers on the adapter are? Understand what I am saying? (I hope so, seeing as you claim to have been a programmer, once).

Want to try putting your 5MHz, or even 8MHz cards in a "new" system supporting 12 or 16MHz bus rates? And expect them to work?

Come on. You know as well as I do that any significant upgrade leaves you with your original power supply (maybe), box (again maybe) and keyboard (if you can still read the keycaps).

BB> "Mauling" metalwork (or plastic, actually) seems to be more
BB> related to "upgrading" STs than PCs.. the openings in PC cases
BB> are all standardized.. not so with Atari stuff.

laugh. I know what you mean about "upgrading" STs, but you're still not there when it comes to the concept of "standardisation".

BB> I dunno why I'd want to put a "real" AT sized motherboard in my
BB> XT case, when there are "zillions" of "mini '386" motherboards
BB> that will fit.. I guess you just don't have the background to
BB> understand to make it worthwhile explaining THAT to you..

sigh... you're still not seeing the point. I was refuting your "it's simple to upgrade" claim, not arguing technical dribble with you.

BB> Guess what, Michael.. for $65, I not only got a nice "mini tower"
BB> case with digital speed readout, but also a 220 Watt power
BB> supply... do you think Howard's claims will invalidate a
BB> 220 Watt supply..?

Aha. Go on, for, say $30 you get a new keyboard, and say $200 for a new monitor... keep going & add it up... say? isn't it cheaper to buy a _NEW_COMPUTER_? Funny, that.

BB> Maybe someday when they have time, the girls in the Terminals
BB> department where I work will have time to explain things to you..

smile nice, almost, comeback. Maybe I'll get the chance to teach them a few things as well... then, if you're lucky, they'll pass them on to you... unless you're too old for their liking.

See? Did you like that? Come on Bob. I know you don't take personally directed replies very well, but at least have the good grace to listen to someone whose spent some time actually _doing_ the work.

I "dropped" a 386sx board into my old 286 case last night... I'm no newbie to the changeover/building game, as I have tried to tell you. It took near on an hour to get it back together, and then I had to pull in a favour on a friend because none of the 4 different IDE paddle boards I had would work with the new board... Not to mention that it (16MHz) can't run zero waitstate on 80ns DRAMs... great stuff, guys.

So much for 'easy'. And if I didn't have the experience, or the contacts, it wouldn't have been "easy" at all... it would have been _very_expensive_.

BB> BobR

If you want Unix, you should not think of Atari as a hardware basis.
Atari Sys V will not be available for the F030, is - as far as I know -
still a developer's release for the TT which is horribly overpriced in
comparison with other proprietary Unix implementations.
Atari dropped further development in ASV, because they finally figured
out that "Unix is no market for Atari". ASV is said to be very stable, but
has an extremly low performance (especially when moving the mouse ;-) !
If they don't improve their device drivers and make a reasonable price,
then ASV is IMHO not at all interesting even for the expected F040.

If you want Unix, better get a 386/486 with Linux or BSD386, or simply
buy a NeXT or Sun Sparc Workstation. There are quite cheap 2nd hand
or clone computers.

Regards, Markus.

>> Maybe there _will_ be a few new titles out right before the 25th...
>
>RJ.. do you really think Aunt Martha will hang on breathlessly until
>right before the "25th" to buy you the latest Lynx games..?

Bob, I already own every title out there. Having Aunt Martha buy me a
Lynx title I don't own is tougher than making Dan Quayle look competent. B-)

(Okay, Quayle jokes are passe now, but it's not the new administration yet,
so why not?)

>What kind of marketing would wait until the *last possible minute*
>before releasing *new* products into the Christmas marketplace..?
>
>Nintendo seems to know... Sega seems to know.. even NEC seems to know..
>why is it that brain abberations are only endemic to Atari..?

Bob, long-time Atari watchers like you and I (come over and let me show you
my once-brand-new Atari 800 computer sometime) know that the Jack Tramiel
Atari Corp. has problems with marketing and promotions. I don't claim to know
exactly why Atari competes "on the cheap", though the lack of finances to
spend on advertising is a good possibility.

But calling it "brain abberations"? That's a cheap shot, Bob. The fact that
Atari manages to _still_ be alive after all this time indicates that they're
not total morons at the top (ask the federal government how many ineptly-run
businesses collapse after their first year). The company's treading water,
which isn't as great as leading the pack, but also beats drowning, too.

(And before we think Atari has no skills whatsoever in handling the Lynx, I
just want to say two words: BATMAN RETURNS. TV commercials, heavy advertising,
movie tie-in, game released _right_before_ the movie premiers...if I didn't
see it, I wouldn't believe it)

Followups to comp.sys.atari.st; I don't defend Atari's actions, but there is
a line between constructive criticism and slander.

>before I have to decide. Thanks in advance. 8^>

I got my HP Deskjet 500 about four weeks ago. You do not need any
special drivers for it. Many commercial software packages support HP
Deskjet (plus, 500) printers. But there is a very good ASCII printing
program called 'Idealist'! You can print every ASCII text in up to 9 (!)
columns and because the Deskjet has some built-in crosswise-fonts (right
word?) you'll need *much* less paper when printing manuals, listings
etc. Idealist is available in a German and English version from the
author (Christoph_Bartholme@ka.maus.de) or via anonymous-ftp from
ftp.informatik.tu-muenchen.de. It's shareware since version 3.2 and
costs DM 20.- (~US$15).

The 500C is 100% backwards compatible to the 500. I don't know of any
program using the colour of the 500C/550C. Maybe Signum!3 colour does.

>utilise them. For instance, I started in the action game, where the
>carrier is off the shore of a hostile island. The laser turret will
>destroy things on the island on the closest shore.

Use the laser turret to take out the missle launchers so your Mantas have a
better chance of surviving...

>I lauch a viewing
>drone, but all I see is blue water - nothing to aim a missile at.

The viewing drone is used to target the cruise missle launcher, which is
mounted to the rear of your carrier. So, if you rotate the carrier 180 degrees,
with its rear facing the island, you may be able to fire some missiles. I
wouldn't bother, though...

>The manta gets damaged shortly after take off and usually destroyed
>shortly after one or two shots.

When operating near a hostile island, you should always keep Mantas under
manual control. The best method for "liberating" an island is to load a
Manta up with the missles, the fly straight for the island command center,
and dump your full load of missiles on it. You should use the same method to
first take out any drone defense units (ya know, them volcano lookin' things)
if there are any on that particular island.

>The walrus gets destroyed upon
>reaching the island. So, how do you go about defeating this island?

The Walrus is next to useless in an assault. All they're really good for is
dropping the command center generator once you've liberated the island.

7018. News about C-LAB and EMAGIC

Newsgroup: comp.sys.atari.st
Date: 1992-12-21 03:27:44 UTC
From: ken@isgtec.com
Message-ID: <3902@isgtec.isgtec.com>
Source record: 213168

The following is a press release from a Canadian distributor about the fate of C-LAB and about the new Notator Logic. I have no connection whatsoever with this company.

==========

From Musicware News Nov. 92:

"Exciting news is on the lips of Midi users around the world. A dynamic new 'spin-off' company has been formed by the key developers and marketing team of C-LAB Software. EMAGIC is dedicated to the design, production and marketing of professional music software and hardware products.

EMAGIC is out to set new standards in the world of sequencing and notation. You probably have already heard of Notator Logic - EMAGIC's new flagship product. It created a stir months before it was even ready to ship. Fourth generation in concept and performance, Logic promises to give all users a new reason to enjoy making music. In the words of Gerhard Lengeling "the Ferrari of MIDI-Realtime-WYSIWYG Score Editors is about to be born". Logic will be released for the Macintosh next month, on the Atari (with TT and Falcon support) during the first quarter of next year and on the IBM PC by mid '93.

Does the change in the distribution of Notator SL mean that product support has been abandoned? Absolutely not! Both Gerhard Lengeling and Chris Adam (the software engineers who created Notator) hold key positions at EMAGIC, along with several other talented developers. You can dismiss any rumours that Notator will not continue to be supported (especially those perpetrated by Steinberg!) as inaccurate heresay. In fact a 3.16 update to Notator will be shipped in November. In addition, registered users of Notator will be offered a soon-to-be-determined upgrade path to Notator Logic.

The EMAGIC development team is also working hard to produce unique software for beginners, along with various hardware and peripherals that will integrate sound editing and system management. Sounds exciting? We think so!

Musicware is proud to be the exclusive distributor of EMAGIC products in Canada. If you wish to receive additional information about Notator Logic and other EMAGIC products, ... <contact us> ..."

7019. 1.44M floppy on Mega STE

Newsgroup: comp.sys.atari.st
Date: 1992-12-21 04:32:48 UTC
From: gt1448b@prism.gatech.EDU
Message-ID: <78660@hydra.gatech.EDU>
Source record: 213337

With all the talk about 1.44 meg floppies on Mega STE/TTs using TOS 2.05/3.05 and the WD1772 chip, I decided to see if my Mega STE would read/write 1.44M floppies. Earlier I had posted to find out whether the disk drive was a 1.44M one and thanks to someones reply, I found out it was. My dealer had showed me where to install the AJAX chip should I decide to upgrade to 1.44M.

I inserted a 1.44M floppy from a PC and it worked! So now my questions are:
1) Is the WD1772 reliable for 1.44M disks?
2) Does TOS 2.05 know how to format 1.44M disks?
3) If the desktop does not know how to format 1.44M disks, can the XBIOS format routine in TOS 2.05 format 1.44M disks?
4) I know there is a DIP switch somewhere that has something to do with 1.44M floppies. What does it do?

Thanks in advance!

> There's suppost to be some new dealer for the country now as well I think.

Yep. Atari sales in New Zealand are now supported by Atari Australia.

Fine - Except for one thing - We're paying over 100% more than our
friends in the USA for the same hardware......and software is STILL
virtually unobtainable through most of the country for those without
Usenet access.

(The notable exception being Nelson because of a very aggressive sales
campaign - run by a local retailer - which put STs in most primary schools
there.)

As a comparison, PCclone hardware is at most 10% more expensive, and Joe
average user can get software at any local shop.

Is it any wonder people don't buy atari in NZ?

Not flaming, just not looking at the mchines with rose-coloured glasses.

I played Carrier Command a few years ago, so I can't remember all the details. But: The standard way of freeing an island is to look for the command bunker on the radar screen (a white dot ?), getting the _back_ of the carrier as close as possible to this shore, firing the viewing drone, and because it flies "backwards" you should be able to spot the bunker and destroy it. Besides the strange behavior of the enemy carrier it's really a great game!

>$799.

But you forget that to get the same *subjective* performance as a F030 you
would have to buy a 486DX33 with a very fast graphicscard that have at least
64k colors, a DSP board of any kind AND something like the soundblaster.

Tell me the price of that!

(btw, I have run Windows on a 486DX25 in 256 colors.. It crawls..)

>Oh, and it would include 2 Megs.

Well, memory aint expensive... Atari should have put in 4 megs as minimum.

>Along with Windows and the choice of THOUSANDS upon THOUSANDS of
>software titles.

I wouldn't put my name on a product like Windows. I would be *ashamed* to
release such a lousy done software. Oh, could you please tell me of some
software which doesn't exists on the ST??

(btw, windows isn't a software title, it's a substitute for MS/DOS ;)

>There are also MANY developers working on new software for it, not
>just a handful. Anyone will fix it if it breaks. And there
>is no need for me to beg the company for support.

Correct!

>No, Atari's needs an edge besides the DSP.

I think Atari has an egde, the question is wether they will blow it or not...

Well, actually it has been done...
A suite of things such as a word processor and a drawing package have been
bundled together under the name "interview". Unfortunately this is all
X based, so not likely to run on a bog standard ST for some years.
The output can be in latex form.
Would anyone feel like converting this? It's only about 30 meg for the whole
lot :-)

The act copyright sanctions is copying. You may sell your copy to anyone you want and that is fully legal. No license applies unless you have actually signed something -- a contract with the supplier. Don't be intimidated by all kind of conditions on the package. They are void, unless they state what copyright law says, and in that case they are redundant.

> continue to hit himself over the head with the "Atari" hammer..?

Bob, sometimes you can be insightful, witty, and even intelligent.
This is not one of those times. I suspect that whatever Dave does, the
GW will be released for the ST somehow... he's put too much of his time
and energy into it to waste it. No programmer willingly tosses out work
just because of a stupid corp... (wisdom of the people I hang out with
is that "stupid corp" is unnecessary - they're all stupid by definition)

> amalaye oyake ---> a curious st user.
>
> No problem.. it's refreshing to encounter an open mind..

And you're a good argument against open minds - you search out innocent
users, and spew garbage at them. I suppose that sounds like you're some
sort of corruptor of innocents, but...

I went off the ST for a while, and searched long and hard for a new
machine. I discovered that replacing my ST with another decent system,
without taking any sacrifices (pathetic sound and OS on the PCs, weird OS
and incompatibility on the Mac (not to mention their expense), etc.), I
had to go up to a NeXT. I don't have that kind of cash, so I'll stay
right here... So it's not like there's much of a choice. If you
personally don't like the ST, go play with others a while - but you'll be
back... In the meantime, don't bullshit at newbies...

: : a 68000 but on a 68030 in a TT or a Falcon it could be quite neat. I have
: : seen it running X on a 486 PC just fine.
: :
: That sounds very good! I was just thinking of gettin 386 for unix,
: and you how much I hate PC's. Now I can get another TT to run unix!
: Yes!

I wouldn't hold your breath. Linux is definitely a quality piece of
work and I have briefly used it, but the author, Linus Torvalds, has
stated on numerous occasions that it is very 3/486 dependent. Rumour
has it that an Amiga port is being contemplated, but this is the
first time I have heard about an Atari port. If you want cheap unix,
a pc clone is probably your best bet at this point.

Cheers,

Chris

> Has anyone actually purchased one of these..?

So what are you going to say next, Bob? That it doesn't count until
YOU see one? Or just find something else Atari's done wrong (not that
there aren't a billion things they've done wrong...) and dig into that?

I think anyone who's had an ST for a while, and certainly anyone who
reads this group, knows Atari's brain-damage well enough... They don't
need spurious BS like you questioning first-hand reports.

Chill for a while, Bob, take a couple of liver pills, and keep the
garbage flow down to a trickle, eh?

I agree with this assessment; Calligrapher is a first-class document processor IMHO (I can't agree with it being entirely "crash-proof", but how much software is?).

> I like the fact that it uses standard GDOS fonts as well as Calligrapher's
> own outline font format. The outline fonts are terrific, and it's incredibly

The ability to use standard GDOS fonts is in my view very important for any ST word-processor. I was therefore disappointed to find that amongst the features listed in the new version of Calligrapher is the abandonment of support for GEM bitmap fonts. I phoned Working Title to check this recently but the person I spoke to seemed not to be in a communicative frame of mind, so I can only guess at the reason for this change.

>
>--
>Warwick

But STILL, the Falcon030 needs more than 1 Meg for these TRUE COLOR
video or they won't even be used.

So what does all this mean now? The games will run somewhat faster
than we thought in true color mode. But, a graphics coprocessor would
still be necessary for rotation, 3-d imaging, scaling, etc.
Because you don't want to have to write these routines into your
game which will not only take up more memory, but also more speed.

EXACTLY!

The Falcon030 MAY be a great machine for music.

The DSP MAY open a few more doors.

And some games MAY be able to be written for the Falcon030.

BUT-- if you don't have developers, dealers, users, and publications that are helping PUSH this machine into millions of homes, the Falcon030 MAY NOT have a chance.

I was kind of disappointed by the lack of a graphics coprocessor and so far, no one has checked to see if Atari may let us add one to the Falcon030 in the future. I don't think we can.

What's going to happen is that the Falcon030 will be competitively priced with PC clones out there. The people that want a computer that plays GREAT games will not see a great advantage with the Falcon030.

And some people have told me, "You want great games? Get an Amiga 1200!"

Hey, this is a billion dollar market, Atari better be thinking about it.

--

7035. Supra 20 Meg Hard Drive for Sale

Newsgroup: comp.sys.atari.st
Date: 1992-12-21 16:47:29 UTC
From: lehmann@cs.tamu.edu
Message-ID: <1h4sf1INN4h2@tamsun.tamu.edu>
Source record: 213341

Well, I am going to sell or trade my Atari Supra 20 Meg hard drive.
It's portable, reliable (no failures or bad sectors), and show box size.
It has a SCSI out so that it can control other hard drive for expansion.

Reason for selling. My father just bought me a 128Mg drive and I want
to use the cash from the 20 Meg drive to buy another ST peripheral.

Here is my selling price: $135 you pay shipping. I'll send you a contract
saying that I'll refund your money if you are dissatisfied with the
product.

Also, I am selling DESKCART! which is a catridge clock plus software in
ROM. It is quite nice, but I now have a hard drive with a built in clock
so I don't need the DESKCART! clock and I have other desktop utilites
to do what DESKCART! does.

Selling price for DESKCART! : $20

Bundled DESKCART! and Hard Drive $140.

Now for the trade part.

I'll trade the hard drive and DESKCART! for:
- A working sound digitizer
- A monochrome Atari ST monitor
- $135 worth of software (like Caligrapher with options, Neodesk 3 and
programming development kit, or some other type of useful tool. I am
needing a good drawing program with postscript output)

Send inquires to lehmann@cs.tamu.edu

7037. Re: So what does this mean to us ?

Newsgroup: comp.sys.atari.st
Date: 1992-12-21 17:22:13 UTC
From: dmb@case.ai.mit.edu
Message-ID: <1h4ug5INN9r8@life.ai.mit.edu>
Source record: 213344

In article <0fq24bj@rpi.edu> oyakea@lib102.its.rpi.edu (Amalaye Oyake) writes:
>1) WILL MR. BAGGET STILL MARKET GAME WORK BENCH OR HAS HE GIVEN UP ?

Really, you can call me Dave. :) The fate of GW is still being decided.
I am only one of two authors; the other is Neil Forsyth. Together we
have to puzzle out whether or not releasing GW now is worth the time,
money, effort, and frustration involved.

>2) IF YOU REPLY, PLEASE STATE IN YOUR HONEST OPINION IF YOU THINK (note i am
>talking to anybody reading this) THE FALCON WILL SUCCEED.

My honest opinion? It has ZERO chance in the U.S. It has a *slim*
chance in the UK. It has a *decent* chance in Germany. I'm only
talking about it not being a loss for Atari here; that's all I can
equate "succeeding" with for Atari.

>3) PERHAPS QUESTION 1) SHOULD BE TITLED CAN MR. BAGGET STILL MARKET GAME
>WORKBENCH ?

Well it's not just mine alone, again. There are clearly NOT thousands
of people out there willing to pay the cost of a compiler for a game
development system for the ST. It's a big system, with as much
capability and documnetation required as a compiler. That means
you have to pay more than fifteen bucks for it. :)

That doesn't mean it's not possible for it to be profitable. No
one really knows right now.

It would clearly be *more* profitable in the long-term to port the
system to other platforms.

>4) WHAT DOES ALL THAT HAS HAPPENED, (CONCERNING MR. BAGGETS VISIT TO SV CA.)
>MEAN TO THE AVERAGE ST USER ?

To me, it indicated that Atari has been pretending to be a big computer
company for a long time. They are now only a shadow of their former
selves, but they have retained one thing: their arrogance. This
worried me. Maybe it doesn't really matter to some people though;
small companies have put out great products before. Atari *could*
still be salvaged; I've emailed Len with various ideas on how I
think it could be done. But it would require a little bit of
divine intervention as well as a solid, aggressive business plan.
(Point 1: get out of home computers and go back to doing what you
can actually get right: game consoles.)

The tremendous amount of infighting also really bothered me. The most
arrogant and obnoxious people seemed to bully their bosses while being

the least competent from a technical standpoint.

>6) HOW WERE MR. BAGGETS GAME ROUTINES SUPERIOR TO ANYTHING DONE BY PEOPLE
>LIKE THE BITMAP BROTHERS (ST DIEHARDS), OR EVEN JEFF MINTER ?

Well, in the specific instance of the Bitmap Brothers, our routines are probably faster. The BB's have done some great games, but their routines weren't really the fastest around.

The BB's also develop for the Amiga and PC (as well as the Sega and Nintendo), so I'm not sure I'd classify them as "ST diehards" anymore.

The intention behind GW was always that it should be easy to use (callable from C), but would be "routines the professionals use." In other words, the assembly code Neil has written to do the blitting and scrolling was intended to be as fast or faster than anything in a commercial game. Despite the widespread belief among game programmers that you couldn't make a general-purpose library and still retain the speed of an all-assembly approach, I think we succeeded. Neil deserves the credit for that because he wrote the RDO (Raster Display Object) manipluating code and the fine scrolling code. Perhaps if you goad him on a bit he tell you why his RDO routines are better than the Bitmap Brothers'. :)

>7) SO WHAT MACHINES WOULD ONE RECOMEND BESIDES A FALCON ?

In the US, at least, you simply can't beat PC clones for price/performace ratio. For those of us who have loved Atari computers since playing M.U.L.E. on their 8-bits this is a bitter pill to swallow.

Macs are more expensive but if you can get an educational discount they're really nice. DTP support is excellent, and they're rapidly taking the desktop video market away from the Amiga. (Macs have had transparent 24-bit video support for two years now, too.)

IMHO, Amigas are going the way of the Atari computers. It's just too difficult to surive in the PC clone/Mac market with mediocre third-party hardware now. If someone were to come out with the 1993 equivalent of the Atari 800 (i.e., something that capable and exciting relative to the current state of the art in home computers), then they might have a chance. Like it or not, Atari owners, that machine was the Amiga in 1985, not the ST. (Though I note with great chagrin that the Amiga was actually designed for Atari by the some of the same folks, like Jay Miner, who worked on the 800.)

I look at the Falcon and the new Amiga machines, and I don't see anything revolutionary. (Tossing in a DSP isn't enough, especially when it should have been a TI34010 graphics coprocessor instead.)

Merely dong sometihng evolutionary won't keep you afloat in today's "100 million DOS machines and 20 million Macs" market.

I have BattleZone for the Atari and find it to be very similar to the arcade version. I think it is acutually put out by Atari (can't recall).

I believe that Midi-Mouse is no longer in business. I have their software (Chord Magic, Note Wizard, Scale Master). It's not bad but nothing great either. A friend of mine bought a copy of Note Wizard and it wouldn't work. He tried to get in touch with Midi-Mouse and had no luck whatsoever. I tried every piece of copy software/hardware that I had access to and was unable to make a workable copy for him from mine. He was not impressed. It has strange copy protection requiring that the key disk be in the drive when you run it (from the hard drive) and this key disk CANNOT BE WRITE PROTECTED or it won't work.

Message-ID: <1992Dec21.175055.20273@cs.nott.ac.uk>
Source record: 213346

Does anyone know of a program to convert GIF files to ST formats
(Neo or Degas preferably) - I know that information will be lost,
but I want to be able to load stuff up quickly, and as long as
the picture looks vaguely OK it doesn't matter.

I know of several programs that can display GIF's, so it must be possible
to `dump' the screen image in another format.

Thanks,
Keith.

Are you impling that the Falcon cant sample at 48 Khz? Or at standard CD rate (44.7 I think)? That's bad. What if you want to edit DAT tapes at
--

If the software supports it, it will handle anything from about 5Khz, to 50Khz, 8-bit, or 16-bit sampling!

(50Khz, 16-bit samples sound PRETTY good, use this Falcon 'Dolby' effect, it sound better than pretty much anything else available!) Unfortunately it also gets pretty large! (1meg every 20sec's of sampling, or probably more....)

I have no idea! 8-)

But, all I do know about it is, you need it on 9600bps, and faster modems
on TOS versions before 4.xx (ALL versions except Falcon TOS apparently).

It stops bits getting lost when the ST can't keep up with them or some
such thing!

Since going to their "flat-rate" plan GEnie has never charged for Eaasy Sabre
(it may appear they are charging due to the dual-door number system GEnie
uses, but once you enter Sabre itself you'll not be charged).

Source record: 213152

I haven't used it with GIFs that were less than 320x200, so I was unaware of this problem. As for the quality of pictures on my humble STE, it is excellent.

>>>

If the GIF's are below 320*200, just use the 'select area' option in Pchrome, it will keep it's original resolution, but the colors will improve.

(In past experience, it's a bad idea to stretch GIF's to larger than original size on the ST, it makes them look odd).

Saw this *incredible* Black&White GIF viewer for the mac', amazing, you could have a 320*200 GIF, expand it to around 500*400 or some such thing, and lose no noticable quality AT ALL! You could also shrink it, save it, and reload it, then stretch it again, and the quality would be almost identical.
I think it was M-GIF or something (not the ST version of course), but I can't remember. Amazing program! (It would of course convert color GIF's into grey-shades)

Well, in one sense, that is as good an answer as any. The $3,000 you estimated it cost you is not small money for a software development firm. Unless you were VERY clear on who you were going to speak with and what you could expect to happen as a result of the meeting, there was little justification for spending that much to meet Atari's wishes.

By the by, you failed to mention in your first posting that Atari asked YOU to come out .. just what was the objective of this 'meeting'? Atari hasn't promoted any third-party software in four years or so. They haven't published anything under the Atari label since about that time either. All of the software which they've been rumored as having purchased has never left Sunnyvale again. Given this basic understanding of Atari Corporation, why did you decide to go in the first place?

>games, so I don't know whats out there.. Whats a real good one?

One of the best games for the STe I know of would be Captive. I
don't have an STe, but a friend who does says the stereo sound effects
add a lot to the game. It'll definately keep you going for a long time,
if you decide to try to play it to the end, but it starts to get pretty
same-like after about 20 levels. Each 10th level is basically a complete
round, so you can finish at anytime you feel like. Knightmare is also
good, as of course, is Dungeon Master and Chaos Strikes Back,
appearantly available now as a set for cheap.
One of the newest games available that is getting a lot of raves
from the few game players left on the ST is Amberstar, which is a good
copy of all the best parts of the Ultima games, with a lot of tricky
puzzles thrown in. It's also the start of a trilogy, so once you finish
the first, there'll be more to come.
On another note, the latest ST Gamers Digest reports Mindscape has
dropped the ST. Has anyone in Britain heard what this means to the
expected release of Captive II, as this was due out on Mindscape?

>I'm not sure of what you're faulting me for here; I expressed amazement
>that after reading the gory details of the visit you place the blame on us
>instead of Atari (this is what I've written above),

The fault, sir, is that given the context of the whole article, it should have been apparent to you (as it was to other readers) that I was NOT finding fault with you at this point. You had misinterpreted the writing. It is as though you have decided that anything which I might say in response to your writing is an attempt to find fault, criticize, or denigrate you.

> but the whole rest of
>this message outlines our blunders, and details how it's our fault that
>GW didn't impesss Atari, didn't make it to market, etc.

The message says nothing about your failure to impress Atari. It does say a thing or two about how I would have responded (and, indeed, have responded) in a similar situation.

It is entirely Double-Click's fault that GW did not make it to market, if, as you've said, the libraries were completed and all that remained to be done was to come up with a manual and market the thing.

>Why should I be your personal secretary?

Did I ask you to be my personal secretary? No. I asked for some COMPANY NAMES. It takes as much time to type 'reply' as it does to type 'follow' in News software. I wanted those names for a reason, which had nothing to do with any desire to show you up for a lying fool (which I don't believe you to be in the first place, so don't try to bring it up in a future post).

>What would that possibly have gained?

Self-esteem. Knowledge that you have higher standards than one of the sons of the owner of a computer manufacturing corporation. A few hours to do something more constructive.

>Would we have made the cost of the trip back?

No. Then again, DID you make the cost of the trip back? One of the hardest things about being in business is knowing when to cut your losses.

>Would we have had a better chance of making a successful deal with them after
>storming out of the meeting?

Was a 'successful deal' one of the clearly held goals of this meeting? From what you have written, it looks as though someone at Atari wrote to you saying "Hi. I hear you've written something neat for game programmers? Would you

like to show us what you're doing?" It's a great ego-booster, but hardly the sort of thing one where one expects a written contract at the end of the day.

>We were entirely professional the whole time. Once we realized that we
>had no hope of striking some deal with Atari,

See above. I would imagine your realization of this occurred sometime within the first few minutes of the encounter -- say, immediately after Mr. Tramiel's quip about lawsuits...

[regarding the Syquest cartridge]

You brought a cartridge with a blank C partition and no desktop.inf to indicate there was a D partition where all of your work was waiting to be shown. If I've misunderstood that, please let me know. It is a simple task to hook up a Syquest drive, and to mount a C partition. If you did not EXPRESSLY tell the technician that the C partition was blank, I do not pity you for the time and trouble Atari had getting the software up and running. It is NOT a 'simple task' when you fail to tell someone that you have a non-standard practice with regard to disk partitions.

>Atari invited us to come out and show us GW. We didn't ask them.

Crucial bit of information here, missing from your earlier posts. As I was reading your other posts, it was a case of Double-Click REQUESTING A MEETING WITH ATARI.

>They weren't going to pay our way, but why would we refuse when they were
>talking about the possibility of bundling GW with the Falcon?

Another crucial bit of information here, missing from your earlier posts.

Then again, given the fact that Atari hasn't bundled any third-party software with the ST in the United States, and given the presumption that Atari is probably not going to bundle a compiler with the Falcon, are you sure Double-Click had a clear set of goals for this meeting?

>We had a contract with DC. Generally speaking, you can't sign on with
>a company and then go looking for someone else. What happened in the
>end is unfortunate. But it was entirely out of our hands once the
>contract was signed. This is the way freelance software works.

Right. And since the origin of all of these threads dealt with the demise of Double-Click, and the 'poor victims of Atari Corporation' was the leading theme, it just goes to show that Double-Click was as responsible for their demise as Atari could possibly have been.

We have only Double-Click Software to blame for the non-release of GW. They could have put the product out there on the market long before the Falcon was officially announced. It is not the fault of David Baggett that GW isn't out there, but then again, it is not the fault of Atari Corporation either. No one prohibited Double-Click from marketing GW when it was first available.

>6) HOW WERE MR. BAGGETS GAME ROUTINES SUPERIOR TO ANYTHING DONE BY PEOPLE
>LIKE THE BITMAP BROTHERS (ST DIEHARDS), OR EVEN JEFF MINTER ?

Better? I dunno. I've never seen anybody else's routines. But Dave
and Neil's stuff was (and, heck, I hope is) going to be publicly available.
The Bitmap Brothers, I would expect, have a great graphics engine, but it
doesn't do me a lick of good if they won't sell it to me. By using Game
Workbench, I got to do all the spiffy stuff the BB and Jeff Minter do, but
without the pain of writing my own library. If that's a way to be better,
then they're better.
(And as a side note, GW is an excellently designed system,
independant of how it runs [but, heh, that's excellent, too]. The calls
are well organized and logically laid out. Similar commands have
similar names and take similar paramaters, overcoming one of the biggest
pitfalls of C -- how to find something in the manual and figuring out
what it does.)

7059. Falcon IBM emul: speed guesses?

Newsgroup: comp.sys.atari.st
Date: 1992-12-21 22:48:35 UTC
From: robert@informix.com
Message-ID: <1992Dec21.224835.1008@informix.com>
Source record: 213133

I use my computer mostly for games and midi applications. Midi was
the reason I got an ST in the first place, and the sound processing
possibilities inherent in the Falcon make an exciting addition to the whole
music processing concept...so I'm seriously thinking about a Falcon.

But I'm not kidding myself; Atari has a history of making poor
marketing decisions. If they promoted this machine right, I think it could
make history...but I don't believe that's gonna happen.

One thing I'm very pessimistic about is whether Atari will be able to
lure games programmers from the PC world into the Atari camp. Will there ever
be a Wing Commander for the Atari? A lot of the reason why some game
producer's dropped the Atari (for instance Sierra's stated reason) was that
it was murder to support Atari graphic standards in addition to VGA, and since
the Falcon can handle VGA, it could just be a matter of dusting off Sierra's
Atari graphics engine (though there's still the matter of sound) to get Sierra
back into the fold.
But again, Wing Commander? I doubt it...and I really want to play
Wing Commander.

So, the Falcon's gonna be able to take a 286, 386, or 486 SX chip
running at 16 mhz. Maybe someone will actually make that happen. My question,
based on a probably faulty understanding of the technology (hint: that's a
plea for no flames, please! I confess ignorance in advance! :-)) is, based
on educated guesses, will a 486SX chip in a Falcon produce a machine that
will run as fast or faster than, say, a 386DX in a "standard" clone at,
say, 33 Mhz (a configuration I've heard is a minimum for playing Wing
Commander without serious slowdown).

It sounds like a dumb question (maybe it is) since a 16 Mhz speed
shouldn't compare with 33Mhz, all other things being equal; but are all other
things equal?

In the limited way I have been able to understand these discussions,
the chip will have a 16 bit bus to memory; the graphics chip will have a full
24 bit access. A "standard" bus (not EISA, or other potential new standard
that's actually 3 years away from becoming a standard) on a PC is 8 bits?
meaning that a 16 bit chip is somewhat crippled in ability regardless on a
"standard" PC, while it can operate at full functionality on a Falcon. Am
I confused in fact or understanding?

Plus, the graphics chip is on a full 24 bit bus? Won't that be
advantageous compared to what can be done with PC graphics boards (a subject
wherein I am completely ignorant) or is graphics technology more bound to
the clock speed of the chip...and what would the clock speed of the Falcon
graphics chip be in comparison to PC graphics boards (average) anyway? Do

any of these questions even make sense?

I understand that I should be able to play a lot of games, of the
sorts I like, such as rpgs and adventure games, with no trouble, regardless.
I'm just curious about games that push the technology, like Wing Commander.

No, Jan, you're right on target. I want to make money although I have NO CHILD-
REN and no other acceptable excuse for wanting to get rich.

My intellectual property (and, as such, the software I write) is mine ALL MINE
all the same if I f*ck my girlfriend with a rubber or without. Who said a
forgotten rubber makes a difference between copyright and no copyright?

7062. Atari 8-bit emulator

Newsgroup: comp.sys.atari.st
Date: 1992-12-21 23:28:41 UTC
From: gjschmid@cantor.math.uwaterloo.ca
Message-ID: <BzMuJt.8p2@undergrad.math.waterloo.edu>
Source record: 213164

I just went through >600 articles, but this wasn't mentioned anywhere, so...

Quite a while back, I picked up an Atari 8-bit emulator for my brother's 1040ST. I believe the name was STXF255, but I could be wrong. It seems to have an option to run programmes off of a ramdisk, but we have not been able to get this to work, despite trying about 4 different ramdisks (everything I could find on atari.archive.umich.edu at the time). Is there anyone out there who is using this successfully? If so, what ramdisk are you using (and where can I FTP it from), and what steps do I have to take to get everything smoothed out?

Please reply by email, as I don't normally read this group.

Dunno. Kind of the same as trying to explain why I had to spend $150 for
a 5-1/4" floppy drive for my $79 Atari 800XL way back in 1985. I did it,
nonetheless, and I wasn't the only one in the world to do it...

>

Actually, the DSP is an exelent 'vector rotation and calculation' engine.
What's left for the CPU&BLiTTER is to draw the vectors and fill the areas
between them! If I got the numbers right, the DSP in the Falcon may multiply
(rotate) some 500.000 vectors/second.. (or 10.000 vectors/frame at 50Hz:^)
Just can't wait to see what a fligtsimulator will look like on this bird!!

>>48Khz and dump them back to DAT? It better have those sample rates. Please
>>clarify this for me.

Neither of those rates are available with any of the onboard clocks. You need
to feed in an external clock signal thru the DSP port to get 44.1 or 48khz.
>
>CD sampling rate is 44.1 KHz. close.

> 16000 G.722 standard
> 18900 CD-ROM/XA standard
> 37800 CD-ROM/XA standard for higher quality
> 44056 some pro audio gear
> 32000 digital radio, HDTV, long-play DAT, etc
>
>will the falcon support these (i believe i have read "up to 50 KHz sampling
>rates" implying this is variable)? i think the most common are/will be:
>
> 8000 8-bit u-LAW mono (voice mail)
> 22050 8-bit linear mono/stereo (Mac compatibility)
> 44100 16-bit linear mono/stereo (audio CD)

The standard rates supported by the built-in CODEC are
49170, 32780, 24585, 19668, 16390, 12292, 9834, and 8195 hz.

These are achieved by dividing an internal 25 MHz clock. If no A/D-D/A
conversion is required, the 32 MHz clock is also available for use (the CODEC
cannot be connected to the internal 32 MHz clock, dunno why. You can feed in
up to 32 MHz thru the external port, tho.) Using just the digital subsystem,
bypassing the CODEC, using the 32 MHz clock, you get
62500, 41666, 31250, 25000, 20833, 17857, 15625, 13888, 12500,
11363, and 10416 hz.

(Oh, using the 25 MHz clock, bypassing the CODEC, you also get 14049,
10927, and 8940 hz.)

Since the clock timers are prescaled by 256, you would need an external
clock frequency of 22,579,200 hz (22.58 MHz) to achieve a maximum sample rate
of 44.1 khz, and 24.576 MHz for a maximum rate of 48 khz.
>
>what about atari/third party 8 channel adapter? will this be 8 stereo channels
>or 8 channels or 4 stereo channels? what sampling rates?

The operating system supports 4 stereo channels, not 8 independent channels.
Sampling rates are up to the hardware provider, but I would expect them to
max out at 62.5 khz.
>
>how will the falcon be for realtime recording (like a multitrack recorder)?
>how well would an $800 falcon compete with a $3000 ADAT (Alesis)? other than
>the Alesis now exists, why would i want it over the falcon (assuming i could
>and would write all my own software)?

I think the Falcon would work very well in this role; haven't used anything
like an Alesis so I can't compare.

7068. Re: Falcon030 Resolutions - 1 Meg not enough?

Newsgroup: comp.sys.atari.st
Date: 1992-12-22 00:54:16 UTC
From: hyc@hanauma.jpl.nasa.gov
Message-ID: <1992Dec22.005416.1893@elroy.jpl.nasa.gov>
Source record: 213165

Hm. Let's try this from the beginning... The Falcon can display graphics in a number of different resolutions. It can also use a variety of devices to display on, e.g., SC1224, TV, or VGA monitor. There is a fundamental difference between a VGA monitor and a TV or SC1224 monitor, though - the VGA monitor scans twice as fast as either of the other two. (I'm going to just say "TV" from now on, since the 1224 and TV are functionally equivalent - same scan rate, same rez.)

Ok. Let's think about how a TV operates - the US NTSC standard puts 525 scan lines per video frame, but only draws half of those scan lines per field. I.e., the TV screen is refreshing at 60 hz, but only one half of the image is drawn during each refresh. One "field" consists of odd scan lines, the other field consists of even-numbered lines. This is just how the interlaced TV video works. So while you have a field rate of 60 hz, you only have complete frames at 30 hz. Each field consists of 262.5 scan lines. The name "interlace" arises because the scan lines are not drawn contiguously in each field, instead they are drawn with a 2:1 interleave....

Of the 262.5 scan lines available in every 60 hz interval, a portion are pretty much invisible because they occur above or below the visible area of the CRT's picture tube face. The exact number available will vary from set to set, so computer-generated displays generally pick a conservative number of lines to use and center that in the 262.5 that are available. (Remember the 8-bit Ataris? 320x192 display, but you could alter the display list and make it 320x200 or 320x208 with no trouble, just by removing black lines from the top and bottom of the display list...) This is the principal behind "overscan". On the STs the number chosen was 200, even though, by tweaking the vertical size control on the monitor, you could easily get 250 or so scan lines drawn onto the screen.

So anyway - with a TV, you can draw 262.5 lines 60 times a second. Or, using interlace, you can draw 525 lines 30 times a second.

In article <1h0uavINN2tt@golem.wcc.govt.nz> wells_s@kosmos.wcc.govt.nz writes:
>What's the difference between line-doubling & interlace anyway??

As I mentioned before, the VGA standard scans twice as fast as a TV. That works out to something like 480 lines, 60 times per second. In order to get a VGA monitor to display a 200-line screen, you need to either slow down the VGA display, or artificially increase the scan-rate of the video data to match the VGA scan rate. Since VGA uses a fixed frequency (i.e., incapable of multisync) the Falcon uses line-doubling. That means that every scan-line of a 200-line image is sent out twice, at the normal VGA rate.

So, in essence, interlace and line-doubling are completely opposite. Interlace is a technique to display more lines than are possible to display

on a slow display device. Line-doubling is a technique to display fewer lines
than ordinarily possible on a faster display device.

Please note that this is not the same meaning as "line-doubling" applied to
HDTV, IDTV, etc. (In which case, line-doubling means de-interlacing an
image, to get e.g. 525 lines per screen, 60 times per second...)
>
>I think what Len is possibly trying to get at (correct me if I'm wrong
>Len 8-) is this.
>
>is the VGA mode capable of being displayed on a normal TV/colour monitor,
>and is this what the overscan makes possible?

There are no "VGA modes." There are various resolutions, each of which can be
displayed on a VGA or TV display (with the help of various special techniques
like interlace or overscan).
>
>(e.g. the VGA 320*240*256 mode) - is this mode just the falcon
>320*200*256 mode with overscan being used on the vertical resolution
>to get the extra 40-pixels?

The 320x240x256 resolution is displayed using line-doubling on the VGA, and
using overscan on the TV. It is not a "VGA mode" since there is no such thing.
>
>So, basically - is it possible to use a normal TV or monitor (colour
>of course) to displayer the 'normal' resolutions, AND the VGA resolutions,
>or is a VGA monitor *required* for the VGA res's??

As I've said many times before, all of the available resolutions can be
displayed on a TV. You can't use a VGA trick (like line-doubling) on a TV,
but then again, you don't *need* it there anyway. On the other hand, not all
resolutions are available on the VGA. (I.e., no 640 wide true-color resolutions
can be displayed on VGA.) [I don't feel like rehashing the reasons for that...
}-)]

7070. Re: HP DeskJet 500C Color Printer compatability

Newsgroup: comp.sys.atari.st
Date: 1992-12-22 01:03:47 UTC
From: rchan@terapin.com
Message-ID: <rchan.2vl2@terapin.com>
Source record: 213183

]Since HP has their newest line of DeskJet printers out now - the 550 and the
]550C (mono & color, respectively), the price on the 500C has fallen
]dramatically (almost $200 less). So, I am seriously considering getting a
]500C for my Mega4STe/1040ST computers. Has anyone ever used HP DeskJet
]printers with ST's? Are there incompatibilities? Are there any special
]drivers, etc., that I will need to get? Any info will be appreciated, so
]please reply with whatever you insight you may have. I don't have much time
]before I have to decide. Thanks in advance. 8^>

I have not used a color HP DeskJet, but I have had HPDJ 500 for over a year. It works fine with Atari; just plug it into the parallel port and no problem. However, some computers like mine like the DeskJet to be on BEFORE you boot the computer. If I don't do that, then the Atari (Mega ST) won't even know it's there. If you don't have a DJ driver, you can usually get away with an HP II driver. Color drivers are available for PageStream... I don't know about anyone else.

The drawback is that you have to be picky about paper. What is great for a photocopier or laser may not be the greatest for a inkjet. 25% cotton bond in general gives the best results, but most people won't notice. Hammerhill Laser Print (24#) and Solar Copy paper are pretty good for regular wood pulp stuff. Wilcopy DP is borderline. Strathmore Legacy paper works great when it is new, but seems to get worse as it sits around.

HPDJs are short on internal fonts, but with a DTP or GDOS (yuk) wordprocessor, you should get nice results.

7071. Falcon030 -- Truth not Fiction

Newsgroup: comp.sys.atari.st
Date: 1992-12-22 01:08:04 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <1h5ppkINNp78@usenet.INS.CWRU.Edu>
Source record: 213166

Ok, I'm going to ask a few questions and I only wish for people that know enough about the Falcon030 to answer them.

If you do not believe you can answer the question comfortably, don't answer it.

I'm finding out that many of you THINK you know the answer and reply as you KNOW for SURE, but you really don't know what you are talking about.

IS the Falcon030 with a Motorola 68030 16 MHz CPU powerful enough to produce games that require scaling, rotation, scrolling, and 3-D imaging? I'm talking WITHOUT a blitter and DSP chip.

Is the Falcon030 with a 68030 16 MHz CPU and Blitter 16 MHz powerful enough to produce games that require scaling, rotation, scrolling, and 3-D imaging?

If so, what does the Blitter do to help? And how did Atari manage to make the Blitter faster?

And WHY did Atari make the Blitter faster?

Can the DSP help at ALL in video games such as flight simulators?

I was told that since the DSP can only transfer information at the rate of 1 Mb/sec, it would not help much. Is this true?

How much slower would a game such as "Sonic" run in TRUE color video vs. 256 color video?

How many people believe that 1 Megabyte should be the lowest amount of memory Atari should include with the Falcon030?

How many people believe that 2 Megabytes should be the lowest amount of memory Atari should include with the Falcon030?

How many people believe that 4 Megabytes should be the lowest amount of memory Atari should include with the Falcon030?

Please consider this from a marketing stand-point as well as programmers view.

Also explain WHY you believe it should be sold with this minimum instead of the others.

Should the Falcon030 have had a graphics coprocessor in it?

How much of an advantage would the Falcon030 have with a graphics coprocessor in video games?

How much of an advantage would the Falcon030 have with a graphics coprocessor in video production?

There is a rumor that the Jaguar will be similar to the Falcon030 with a Motorola 68030 16 MHz CPU, but with a 64-bit graphics coprocessor. How many of you believe that this could be possible. Why or why not?

If it was possible for Atari to redesign the Falcon030 and incorporate this graphics processor and then slip it into the production line in the middle of next year, do you think it would be a good idea, why or why not?

How many of you feel that a graphics coprocessor is so important to the success of the Falcon030 that it would be worth delaying the machine another 2 months to include one?

There will be flickering in interlace video mode on TV, how noticeable will this be?

Translation: Will it give you headaches if playing video games on TV in interlace mode?

How many people believe that Atari should concentrate on music with the Falcon030?

How many people believe that Atari should concentrate on entertainment with the Falcon030?

How many people believe that Atari should concentrate on multi-media with the Falcon030?

How many people believe that Atari should concentrate on video production with the Falcon030?

AND WHY DO YOU BELIEVE SO?

Is there any other market that you believe Atari should be going after with the Falcon030?

How many people believe that the Falcon030 will be WAY underpowered as a home computer in Fall, 1993? And why?

How many people believe that the Falcon030 will be WAY underpowered as a home computer in Fall, 1994? And why?

How many people feel that they will be using a Falcon030 in 1995?

How many of you believe that Atari's present keyboard in the Falcon030 should be replaced with a better quality keyboard?

What is your greatest disappointment with the Falcon030?

What do you feel Atari should have included with the Falcon030 that they left out?

What do you think is the greatest advantage that the Falcon030 has?

Do you think Atari will still have this advantage in 1994?

If you were Atari, how would you market this computer?

Are you going to buy a Falcon030?

If so, WHY?

If not, WHY?

If you were the chief designer of the Falcon030 33 MHz computer,
what would you want it to have? Eg: Chips, Case, ports, etc.

What markets would you concentrate with it?

If you were the chief designer of the Falcon040 33 MHz+ computer,
what would you want it to have?

What markets would you concentrate with it?

Do you have a Falcon030 computer already?

Thank you and please keep it to the net if you can, if you can't
post, send me e-mail.

7072. Re: Seeking help from UltraScript users

Newsgroup: comp.sys.atari.st
Date: 1992-12-22 01:10:17 UTC
From: rchan@terapin.com
Message-ID: <rchan.2vm8@terapin.com>
Source record: 213182

```
]I bought UltraScript in the hpe that all my PostScript needs will be
]satisfied. It works most of the time but occasionally it just crashes
]on bits of postscipt like " ... variable 1 sub ..." or it complaims
]that the current point is not set. Before I print with UltraScript
]I try it out on 'pageview' on a Sun and fix all the postscipt errors
]there. Hence, it cannot be an error in my postscipt code.

I don't know what the specific error means, but one sure fire way to confuse
UltraScript is to try and send a soft Adobe Type 1 font to it. UltraScript
only supports its own disc fonts and PostScript type 3 fonts (ones sent by
PageStream for non LaserWriter fonts). If you are... stop! Send only fonts
you have on the HD or PageStream fonts... If this is not the case, I have no
idea what it can be. I have had no problems beside this one.

I want to get GhostScript, but I have to arrange to get e-mail downloaded here.
Oh well...

Or... if you have deep pockets, get CompoScript. I heard it's better.

7073. the "real" Gemulator 2.0 features

Newsgroup: comp.sys.atari.st
Date: 1992-12-22 02:07:41 UTC
From: darekm@microsoft.com
Message-ID: <1992Dec22.020741.23760@microsoft.com>
Source record: 213174

This message is to clear up some confusion. Two German magazines have published rather bogus reviews of Gemulator because they either didn't wait until we shipped them review copies of the product or as in the case of ST Magazin, got a total idiot to do the review which ended up being full of incorrect statements, including incorrect system requirements, incorrect benchmark results, and even listed the wrong price and wrong dealer! The price in Germany is not 555 DM and the distributor is NOT Richter. My sources indicate that Richter is actually cloning the Gemulator boards and selling pirated versions of it. ST Magazin at no time contacted us to verify their facts nor did they inform us that they were even reviewing the product!

ST Nieuws magazine in Holland and Computer Paper magazine in Canada have already published reviews of the 2.0 product and they give more accurate reviews.

THESE are the facts:

Gemulator is the Atari ST emulator for use on 386/486 DOS based computers that provides emulation of color and monochrome screen resolutions, floppy disk and hard disk support, printer support, TOS 1.0 1.2 1.4 1.6 and 2.06 support, and runs such ST programs as Calamus SL, Pagestream, First Word, Prism Paint, Degas Elite, Silhouette, and many others on your DOS or Windows based PC.

Gemulator is available from dealers in the U.S. and Canada. French, German and U.K. versions (with French, German, and U.K. TOS 2.06 ROMs respectively) will be available at Atari dealers in Europe in January. European users need not purchase the North American version since the European prices will actually be lower than the current U.S. price of $299.95.

Gemulator has the following features and improvements when compared to the version that was reviewed in ST Magazin and Atari Journal:

- full speed ST emulation on a 25 Mhz 486SX (formerly required a 33 Mhz 486DX)
- emulation on a 386/33 is 2/3 the speed of an ST
- emulation on a 486/50 or 486/66 is over 2 times the speed of an ST
- read/write access to multiple partitions on the PC's hard disk
- requires 4 Mb of PC RAM (formerly 8 Mb)
- emulates 512K, 1M, 2M, 4M and 8M of ST RAM
- faster load time due to smaller EXE file size (1.7 meg vs. 2.9 meg before)
- real time clock support (file timestamps are now correct)
- smoother and more responsive mouse, and compatible with Maccel 3
- support for TT medium resolution graphics (640x480 in 16 colors)
- one keystroke resolution changes between mono and color
- floppy disk reads are 50% faster than before
- improved compatibility. Now runs GFA Basic 3.6 and other programs.
- automatic configuration using INI file

If anyone is aware of pirated versions of Gemulator being sold anywhere,
please contact us immediately in writing or FAX at 206-885-5893.

- Darek

7074. Re: Falcon and Unix Sys V

Newsgroup: comp.sys.atari.st
Date: 1992-12-22 03:46:44 UTC
From: SML108@psuvm.psu.edu
Message-ID: <92356.224644SML108@psuvm.psu.edu>
Source record: 213170
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I may have been the one to mention the Atari ST linux port first so let me clarify EXACTLY what I said. To my knowledge, NO ONE is working on a linux port to the Falcon. I am interesting in working on the port however. Unfortunately, I do not know enough unix guts to do it myself. I am interested in forming and participating in a team effort to do it... I am of course probably biting off way more than I can chew but 500K of my research software runs under X and the thought of being able to run it at home is too intriguing to resist...

I REPEAT NO ONE TO MY KNOWLEDGE IS WORKING ON AN ST LINUX PORT... Do you wish to work on it? Contact me by email. If there is enough interest, we can start a mailing list to decide whether this is feasible and if so, DO IT! I am incapable of doing the port myself...

I believe that such a port would bring the ST back to life despite the Katzenjammer kids... It won't make anyone a millionaire but it'll help keep it alive... As usual, Atari has given us an interesting computer, but now they are going do absolutely nothing to support it so it will survive but hardly prosper. Who cares? The PC still has $h!++y graphics and sound and it seems like it always will... So unless we're willing to sell out we're going to have to do this ourselves...

A >friend of mine bought a copy of Note Wizard and it wouldn't work. He tried to >get in touch with Midi-Mouse and had no luck whatsoever. I tried every piece of >copy software/hardware that I had access to and was unable to make a workable >copy for him from mine. He was not impressed. It has strange copy protection >requiring that the key disk be in the drive when you run it (from the hard >drive) and this key disk CANNOT BE WRITE PROTECTED or it won't work.

A friend of mine used to have his software distributed by Midi Mouse, and actually developed that copy protection. It's a laser hole on the disk, and the program tries to write to the damaged sector, and if it can, won't run. I don't know about the other authors who had programs distributed by Midi Mouse, but my friend does not speak highly of them, and had to have a lawyer phone them to get them to stop selling copies of his software after their contract expired.

[millions of questions deleted]

>Are you going to buy a Falcon030?
>
>If so, WHY?
>
>If not, WHY?

You want an individual, personal answer, with an honest opinion?

Yes. I will buy one within the first week they are available, because I suspect I will have a lot of fun with it. I believe that in general, I like the kind of people who buy Atari's. Somehow, we have lots of fun. (really)

Everyone I know who buy's Amiga and Atari ends up having lots of fun with their computers. I'm simply one who opted for Atari at first, a matter of lower cost in the 1985 days. (I was 15 then, a young teenager.)

I'll be frank. For 5 out of 7 years I had my ST, I had lots of fun with it. It cost more money than 'other' computers to upgrade (for example to get a double sided drive, TOS in ROM, 1 Meg ram, etc.) but the people on local BBS's that had ST's were always a lot of fun to chat with and it was worth it. We enjoyed programming weird things, playing games, discovering new software, etc.. Sure, things change, and In the last two years or so I have sorta outgrown my ST, and besides there's not much action in the local Atari community. So I've been saving up, ignoring home computers in general and using the ones in school. But, I'd like to have a new computer at home and the Falcon sounds like more fun than a PC or MAC would be. It is cheap too.

When I get the Falcon, I plan on spending a fair amount of time writing some colorful 3D graphics routines (the Falcon may not be too powerful, but in my case I don't care since for really processing-intensive graphics I will end up using the Iris workstations we have access to for our 2D/3D graphics course in university), I will learn about DSP programming, and try my hand at voice recognition, neural-nets, etc. with the DSP. The Falcon will be a useful learning tool for my general C.S. knowledge.

Also, I like to support the underdogs.

Moreover, I also think the Amiga is very interesting too. If the Falcon didn't have a DSP, I would give the Amiga 1200 a much closer look.

Final clarification: Its not so much the fact that the Falcon is overall much more powerful than the ST is that I will get one, but more that reason also combined with a renewed interest by a given group of people towards a computer. People (at the very least myself) will get more motivation, I think, out of newer, and fancier hardware.

P.s. You realise that I speak as someone who uses their home computer not only for real-life tasks such as Word Processing, etc. but also as a tool to hone my programming, game playing, and .GIF picture admiring skills. Have fun, Len. I hope you understand my point of view, and feel free to reject, accept or ignore it.

>
>How about $300 as a reason..?
>

While I don't have a schematic for the Falcon, I assume it still uses a Floppy Controller Chip and still has the Yamaha chip. If this is the case, is there reason a person couldn't just daisy chain one in to the 34 pin cable that goes to the internal floppy drive?

Even if they didn't run the trace from the Yamaha for DS1 (vs. DS0), you could always run one with a wire.

I am assuming that they didn't pull the same trick they did with the XL/XE (concerning Joystick ports 3 & 4 and that "extra" 16K of RAM). The XBIOS and thus GEM probably would still support it just fine, and if it don't, it's in RAM on the Falcon (loaded in from Disk), so thats no problem.

Next subject: The LAN connector.

Does anybody know how to put Ether-Net on a Falcon? (So it can be connected to my Unix Box?) I've never heard of "Local-Talk" before, and I don't own a Mac.

>>Right?
>
>Well, in one sense, that is as good an answer as any.

I couldn't disagree more. I suppose if we'd walked on water at the meeting you'd say we'd obviously blown it because "Atari wanted to be sure we could swim!"

Sorry, but your defense of Atari in this matter is, as far as I can tell, purely contentious. They screwed up, big time. Wheter or not we spent too much on the trip, blah, blah, blah is irrelevant.

>The $3,000 you estimated it cost you is not small money for a software
>development firm. Unless you were VERY clear on who you were going to
>speak with and what you could expect to happen as a result of the
>meeting, there was little justification for spending that much to meet
>Atari's wishes.

You TOTALLY are not getting the picture here. NO business deal works like you've described here if you're working with trade secret hardware and are under nondisclosure. Atari was going to tell us about their Falcon plans at the meeting -- that was part of what it was for -- and not earlier. That's the way companies do business. Again, you are utterly naive if you think that when a big company like Atari says, "Hey, we like what we've seen of this; come talk to us about bundling it with our new machine" you start laying down all sorts of conditions that you'll walk away from the meeting if you don't get. When you get an offer like that, you assume the company isn't jerking you around. (Why should you assume they are?)

It's a matter of leverage. In a situation like that, you have everything to gain, and they don't really need you. So you comply with their terms to the greatest extent possible; if you bitch and threaten to walk out, and they say, "OK, you lose," then what have you gained? Nothing. You can't be big man on campus when you're dealing with a company that's got a million times your resources.

If you come into deals with the attitude you've described above, then you'll regularly blow deals. And key deals come only very rarely, even for the lucky. You have to seize the good ones and not blow them. Sucking up his pride and dealing sycophantically with IBM eventually

allowed Bill Gates to build a software company big enough to later tell IBM to go screw themselves. Whether or not you like Bill personally, the example shows clearly why your approach doesn't work and his does.

Your demeanor suggests that you believe you know what you're talking about, but I think you should read more about business, and about the software business in particular, if you plan to do any serious negotiating with big computer companies like Atari. Your notions about much of the process are very idealistic.

This kind of idealism is quite common in this group, from the whole "software should be free" thing to the "I just can't program a segmented architecture, so I'll restrict myself to a shrinking, unprofitable market instead" threads we've seen here in the past.

I thought that my post about my experience with Atari would help many people see how unrealistic these ideals are in practice. It wasn't intended to be the nail in the coffin for Atari, or anything like that. Readers of this group are bombarded with so much hype and disinformaton -- from Atari HQ, the Cheerleaders, and others -- that it seemed like it was necessary to inject some unpleasant facts about the "other side" into the discussion. Lord knows it's hard to say anything even slightly negative about Atari or their machines here without getting jumped on (look at all the abuse you've heaped on me here in this latest Atari Zeal vs. dmb@ai.mit.edu thread, for example), it's no wonder the sobering truth about the Atari world is stifled. You can't even post prices out of a magazine without getting accused of fabricating data. Magazines that print negative material are slammed, while the Atari party line rag is praised.

Your assessment that $3,000 was too much to spend seems similar to telling someone, "Yes, you were seriously injued when the drunk driver ran over the median and hit you head on, but 65 mph was too fast to have been going." Who cares? If Atari hadn't acted inappropriately, I wouldn't care if it had been 1, 3, 10 thouand dollars; it would have just been a lost investment, not a fee in a game of "I'd like to buy an Argument ... Abuse is down the hall."

Had we paid the money for a real meeting with Atari, we wouldn't have felt that the money was wasted. But we didn't GET a real meeting with Atari -- we got about 5 hours of non-stop abuse instead. Have you ever had someone tell you to your face, "Why did you work on that for 5 years, it's such a piece of shit, you've wasted my time showing it to me?" If you haven't, think about it how you might feel. Hurt? Mad as hell? Completely astonished?

GW is by far the most successful software project I've ever worked on. (And I've worked on plenty.) I remember back when we were doing prototypes several years ago, we wondered whether it would even be possible to do what we wanted and still retain the speed required for professional games. We were both skeptical about that.

But it worked out, and it worked out even better than we could have hoped. It is a revolutionary system, one that makes writing REAL games orders of magnitude easier. We knew that it would be, since our design was ambitious, but we were really only sure it would all work without major downsizing of the "requirements" towards the end.

Everyone who has used it loves it; you've read the notes from some of the beta-testers -- we aren't paying them to write that stuff. Friends of mine who have been using versions of GW for the last three years say that they can't imagine writing a game without it now. (Which is why they aren't busily writing games for their PC's now.)

It's a good system, and one I'm very proud of. But despite my confidence in its quality, the insults they threw at me for it were very troublesome. Though you love and believe in your child, it still hurts to hear someone rip him apart verbally.

There was no excuse for it. You're wasting your time trying to defend that kind of behavior. Even if GW *were* garbage, there'd have been no excuse. I don't fault Atari for not liking GW, or endorsing it, or bundling it with the Falcon. I *do* fault them for not even bothering to let us tell them about it, and I *do* fault them for not having the strength of character to be professionals (in the case of the peons and Leonard), or enforce professionalism in their ranks (in the case of the rest of the management).

>By the by, you failed to mention in your first posting that Atari asked YOU to
>come out .. just what was the objective of this 'meeting'?

Look, there are dozens of things I "failed to mention in my first posting." That was intentional. I focused on the major points and left it at that. The 25 page diatribe I *could* write about Atari would be neither as interesting to readers of this group nor as incontrovertable.

I'm not going to give you every detail of our business plan, and I don't have to, just like I don't have to email you phone numbers of companies or post an ad for a clone manufacturer here.

There are reasons to keep many aspects of this whole affair in confidence. I have already given you a lot of information on which you can form an opinion. I see no need to further divulge information personal to me to defend my position on the matter; none of the attacks so far have really been substantive anyway.

>Atari hasn't promoted any third-party software in four years or so.

What the hell is MiNT? Think of GW as the MultiTOS of games, OK?
I shouldn't have to spell this out. Where GW would fit into the overall Falcon picture is obvious, particularly given the fact that they told us they wanted the Falcon to be a strong games machine.

They were excited about the Falcon; it was "coming out in August," they're were going to "turn things around" -- everything was going like gangbusters there for a while. It looked like it might work out for

Atari after all. We thought GW would only help, but we had other plans for it anyway, so we weren't betting the farm on Atari taking it on; that was a bolt out of the blue anyway. (One that ended up nearly incinerating us, too. But I digress.)

With perfect hindsight, I wouldn't have done anything different. Despite the fact that it was an emotionally demanding several days, I learned a lot from that meeting. For example, I learned that even when assaulted by a constant barrage of insults from a group of rude, technically incompetent hecklers for several hours, I can still keep from cracking and flying into a berzerker rage. Since, chances are, I'll never be treated as badly as that again in a professional meeting, I've discovered something useful that I can rely on personally. (I think that being on Usenet for seven years helped too. :)

So things were gained. Just not monetarily.

I only wish that we could trade places so that you could see the absurdity of your analysis of the situation. You don't know how good GW is, how bad Atari is; and you have the benefit of both hindsight and a complete lack of emotional investment in this. I have the feeling you'd be quick to say that the Allies should have stormed Germany in 1938 in anticipation of the coming war too. The thing about history is that it's a lot different when it's NOW than when it's THEN. What is reasonable in retrospect is often unrealistic or inappropriate at the time.

>Given this basic understanding of Atari Corporation, why did you
>decide to go in the first place?

You go to such lengths to defend Atari and blame the whole thing on us, yet you conclude by asking me why, given the fact that Atari is so screwed up, we even bothered dealing with them at all!

Why? Because the idea that GW could be made an integral part of the Falcon was entertaining and potentially lucrative. At that point, despite having heard many bad things about Atari, I still thought giving them the benefit of the doubt (and not, for example, totally refusing to talk to them) was prudent.

Oh Jeez, lose the pseudo-polite "sir," will you? Regardless of your original intention, you're certainly "finding fault," "denigrating," and "criticizing" now, so why the semantic games?

You're not really going to suggest that anything you've said so far has been *constructive* are you? Your whole point seems to be to illustrate why DC deserved to go bankrupt, and why my posting of the SunnyVile event is somehow irresponsible.

You go on to place blame on us for this, that, and the other without knowing the whole story, and then bitch at me for not giving you my personal diary on the whole matter. You don't know more than about 5% of the facts here, and that's not going to change, and you're just going to have to deal with it.

>The message says nothing about your failure to impress Atari. It does say a
>thing or two about how I would have responded (and, indeed, have responded)
>in a similar situation.

Ah, so you were just speculating HYPOTHETICALLY. You're back-pedaling. The same guy who wrote

What *I* would have done if *I* were meeting with Atari...

and has being vehemently defending Atari against all reason in every related thread is NOW trying to suggest that he was in NOW WAY criticizing DC or me. Give me a break, you've been flaming my butt off since this thread started! (Not that I mind, but still.)

>It is entirely Double-Click's fault that GW did not make it to market, if, as
>you've said, the libraries were completed and all that remained to be done was
>to come up with a manual and market the thing.

Yes, and I have defended, and will continue to defend DC here because
I think your analysis is overly-simplistic and marred by the fact that
you have only a marginal knowledge of the facts involved. (For example,
you have no real knowledge of how difficult it would be to market GW,
since you have no knowledge of how large or complex a system it is.)

>>Why should I be your personal secretary?
>
>Did I ask you to be my personal secretary? No. I asked for some COMPANY
>NAMES. It takes as much time to type 'reply' as it does to type 'follow' in

>the first place, so don't try to bring it up in a future post).

Well, I had put the magazine AWAY and didn't FEEL like dragging it out
again simply because you were too LAZY to get your own information by
walking to a bookstore. As for your complaints about my insinutations,
you never mentioned that you wanted the numbers for any particular
reason, so I had no reason to suspect you weren't just going to use
them to check up on me. (Which would be fine, but I wouldn't go to any
trouble to help you.)

Had you just told me you wanted the information because you were
looking to buy a PC, I might have had more sympathy. At this point I
don't even know what page I was quoting from; I just picked a random
one that had cheap prices. (Besides that, they're already out of date.)

YOU could just as easily have (R)eplied with a non-hostile email note
explaining why you wanted the info as well. YOU could have read my
mind just as easily as I could have read yours.

>>What would that possibly have gained?
>
>Self-esteem. Knowledge that you have higher standards than one of the sons of
>the owner of a computer manufacturing corporation. A few hours to do something
>more constructive.

Actually I left that meeting with more self-esteem, not less. "What
does not kill us makes us stronger." Also, what better ego-booster
than knowing *intimately well* that you could single-handedly run a
computer company better than the half-dozen people who are now running it?

I HAVE the knowledge that I have higher standards than almost everyone
I met with there. Walking out or not would not have changed this,
except that if I'd walked out I'd have felt like I'd actually let them
get under my skin.

A few hours? I suppose I could have seen another movie.

>>Would we have made the cost of the trip back?
>
>No. Then again, DID you make the cost of the trip back? One of the hardest
>things about being in business is knowing when to cut your losses.

Don't you see? Your suggestion would leave us worse off without gaining us anything. All things being equal, you shouldn't storm out of a meeting. That doesn't help your case later when you cry foul, for one thing, and for another, why be a pain in the butt under any circumstances? It's never useful to be a hothead.

Walking out would have left zero chance of success. Waiting it out would still leave us with a possible "let's have you talk to some other people here" option. Or a, "Gee, I'm sorry they treated you badly, why don't you come out and show your stuff to me personally and I'll pay your way" reconciliation from one of the higher-ups.

You're equating the chance of those events with zero just because you know they didn't happen. But such things weren't really that unlikely. Had we walked out in a huff, we could have hardly expected sympathy from the management. (If you hadn't already guessed, Leonard isn't management in anything other than ego.)

>Was a 'successful deal' one of the clearly held goals of this meeting? From
>what you have written, it looks as though someone at Atari wrote to you saying
>"Hi. I hear you've written something neat for game programmers? Would you
>like to show us what you're doing?" It's a great ego-booster, but hardly the
>sort of thing one where one expects a written contract at the end of the day.

Well, yes. We did not go out there just to inflate our egos. There was explicit discussion of how GW might fit into the Falcon plan beforehand. They weren't about to go blabbing details about their top secret machine until we demonstrated we were serious about their offer, but there WAS some discussion.

>>We were entirely professional the whole time. Once we realized that we
>>had no hope of striking some deal with Atari,
>
>See above. I would imagine your realization of this occurred sometime within
>the first few minutes of the encounter -- say, immediately after Mr. Tramiel's
>quip about lawsuits...

Yeah, possibly, but what's your point? That we SHOULD HAVE STROMED OUT, right? You're just wrong about that; that's simply not a defensible position. How can you talk about your business expertise when you advocate such bullheaded behavior?

You ALWAYS try to save the deal. You ALWAYS make concessions with the "big guy" to save the deal. You ALWAYS put up with crap from the "big guy" to save the deal. If you want to be successful in business, you simply cannot care about your ego or moral superiority relative to the other side. Such things are irrelevant.

Only if terms have been discussed and you find the terms to be out of your favor IN AN ABSOLUTE SENSE, and only when negotiation of the terms with the people in charge seems fruitless , do you walk away. In our case, terms were discussed only vaguely. No deal was considered. We were just told to leave (basically). Walking away at any time would have been premature. Sam Tramiel could have walked in at any moment

and said, "What the hell is going on here?" and actually heard us
out. It didn't happen, but it could have. Had it happened, we
would have been able to continue in a positive direction. Had we
followed your policy, we wouldn't have been able to do that.

>It is a simple task to hook up a
>Syquest drive, and to mount a C partition. If you did not EXPRESSLY tell the
>technician that the C partition was blank, I do not pity you for the time and
>trouble Atari had getting the software up and running.

1) It's clear you don't pity us for anything. Just thought we'd get that
one out of the way early.

2) You're right, it is a simple task to hook up a Syquest drive. One
element of this task might be checking to see what's on the cart
before abandoning all hope and cursing third party software. I only
had two partitions on there, for God's sake.

>It is NOT a 'simple
>task' when you fail to tell someone that you have a non-standard practice with
>regard to disk partitions.

A "non-standard practice with regard to disk partitions"? Oh man, this
is like absurdist theatre! I suppose I should have also made sure that
I followed "standard disk partition practice" and sized the partitions
according to the MILSPEC standard, instead of making C 9 megs and D 32.

This is totally bogus. Why didn't they ask me about it? Why did it
take them an hour to cobble together a cart drive system in the first
place, when we told them we were bringing a cartrdige?

>>Atari invited us to come out and show us GW. We didn't ask them.
>
>Crucial bit of information here, missing from your earlier posts. As I was
>reading your other posts, it was a case of Double-Click REQUESTING A MEETING
>WITH ATARI.

Well, you were reading wrong. What can I tell you. My middle name
is McAdams, too, but I left that out.

>>They weren't going to pay our way, but why would we refuse when they were
>>talking about the possibility of bundling GW with the Falcon?
>
>Another crucial bit of information here, missing from your earlier posts.

Yes, crucial, so why are you continuing to waste your time analysing a
situation you don't know any facts about? Just because you're
determined to argue every negative thing I say about Atari, whether
or not you have to stretch reality to its most absurd limits to do it,
that's why.

Look, I don't CARE about Atari. They comprise about .001% of my time
and attention now. I do think that DC deserves better than what you
and the "free software vultures" are giving them, but beyond that you

can just merrily toast Atari's wonderfulness all you want.

>Then again, given the fact that Atari hasn't bundled any third-party software
>with the ST in the United States, and given the presumption that Atari is
>probably not going to bundle a compiler with the Falcon, are you sure
>Double-Click had a clear set of goals for this meeting?

See other message. (Hint: MiNT)

>Right. And since the origin of all of these threads dealt with the demise of
>Double-Click, and the 'poor victims of Atari Corporation' was the leading
>theme, it just goes to show that Double-Click was as responsible for their
>demise as Atari could possibly have been.

Now we're finally cutting through all your smoke screens and finding
the real purpose of this whole silly argument. You think I said it was
Atari's fault DC died and you don't like that, because you don't like
me constantly blaming Atari for all my problems.

Well, why don't you argue that instead of telling me what I should and
shouldn't have done with a product you know nothing about in a situation
you know next to nothing about.

The fact is, Atari has done an enormous amount to contribute to the
lousy ST market in the US. While they're not holding a smoking gun
next to DC's head, they have, simply put, frittered away the resources
and talent that once made them great. Atari was a training company for
Jack's kids -- a toy for them to play with -- and now they've broken
it. The thousands of people who have in myriad ways poured their
life's blood into supporting Atari machines -- from Mike Vederman to
Allan Pratt, from Jay Miner to David Small, from BobR to Ralph --
have every reason to feel betrayed.

I read Dave Small's Atari 8-bit column in Creative Computing; I
practically worshipped Atari for their technical wizardry and
creativity. At one time Atari had ties to all corners of not only the
gaming industry, but to the computer science community as well. Heck,
lots of people who have come through this place (the AI lab at MIT)
have worked there; at one point all three of Marvin Minsky's kids were
working there.

The point is that the current management has gone beyond all reasonable
limits of incompetence; they have done a worse than disgraceful job
over the past few years, and even Atari die-hards must, in their heart
of hearts, admit that. And because of it all, the Mike Vederman's,
Allan Pratt's, and BobR's out there have either quit entirely or still
hang on for inexplicable reasons, bitter to the bitter end.

>We have only Double-Click Software to blame for the non-release of GW. They
>could have put the product out there on the market long before the Falcon was
>officially announced.

Would it have been profitable? Would it have been a viable product in the dreadful market that Atari Corp. produced through its errors? Given the poor sales figures in the ST market, did DC even have the money to market GW properly, get the manuals written and printed, etc.? You have no way of knowing.

>It is not the fault of David Baggett that GW isn't out there, but then
>again, it is not the fault of Atari Corporation either. No one
>prohibited Double-Click from marketing GW when it was first available.

On the contrary, all three are to some extent to blame. It would be wonderful if we could pin it all on one or the other, but it just isn't that simple.

A sinking ship takes everyone with it. In that sense, Atari is very much to blame.

The architects of a plan that is too grand for its audience have themselves to blame for the plan's failure. In that sense, Neil and I overestimated what the market could bear; we made a system that was too large, too powerful, too expensive, too difficult to support ... too much for too few. The market could support STOS. It could not necessarily support a GW. (More simply put: were ST owners in 1991 and beyond willing to pay as much for a game development system as they were for a compiler?)

A guest that overstays his welcome is later uninvited. In that sense, DC should have dropped the ST years ago, before the bad market drove them to bankruptcy. I know Mike. He loved/s Atari computers through and through. Moving to the PC or Mac is/was very difficult because of this. But this emotional attachment to a dying machine impaired his business judgement. Now that I've seen it happen personally, I won't make the same mistake. You can support Atari for as long as you want, but I don't need any more lessons on why Atari developers leave the market.

Dave Baggett

Mark Hughes writes some stuff:

>I discovered that replacing my ST with another decent system,
>without taking any sacrifices (pathetic sound and OS on the PCs, weird OS
>and incompatibility on the Mac (not to mention their expense), etc.), I
>had to go up to a NeXT.

Wow.. now THERE's an open mind for you.. too bad you didn't
actually take a good look at what else is available in the world.

In addition to the terrific sound and operating systems on PCs,
and the smooth operating system on Macs, you also get the
advantages of support from the company that made your computer,
AND the not inconsequential benefit of wonderful software support
from developers who are *happy* to be in the market.

>So it's not like there's much of a choice. If you personally don't like
>the ST, go play with others a while

I see.. you're "stuck" with Atari, so you're going to badmouth
anything else there might be..

By the way, you must be new here.. go back and actually READ
the things I've posted. Find where I said I don't like my ST..
please...

>In the meantime, don't bullshit at newbies...

I might suggest you do the same.. don't lie to them..
don't tell them everything is rosy in the world of Atariland..
don't tell them that people like David Baggett will always be
around, no matter what abuse Atari Corp may dish out to them.

If David decided to bulk-erase his masters of the Game Workbench
and say "screw Atari", I wouldn't be surprised.

You may consider the truth to be "garbage", but then again,
you're stuck with Atari, come hell or high water, and you have
to reconcile yourself to that. If the truth hurts, then maybe
something's wrong with your slavish devotion to the company..?
Ever give that any thought..?

>No programmer willingly tosses out work just because of a stupid corp...

Don't bet your life on that... you get spit on enough, and you'll
finally say "enough".

David Paschall-Zimbel writes:

>It is entirely Double-Click's fault that GW did not make it to market

(Sheesh.. I don't have time to go through his posting line by
line and point out all his naive and "perfect world" ideas..
I've got new messages from the Indigo Girls mailing list to
read, and "Short Bikers" mail to get to.. things that are
infinately more important than bothering with his naivete`)

Grow up, David... taking pot-shots from the sidelines is
certainly a lot easier than being on the "firing line" as
Dave Baggett is, but it doesn't add much to your credibility.

Go to Sunnyvale and get trashed by Atari like Dave did, and
THEN come back and talk to us.

Talk to Mike Vederman, who had to take a second job to keep
Double Click alive in the wasteland that Atari has created,
and THEN come back and tell us all how it *should* be.

Talk to Charles F. Johnson and John Eidsvoog, and find out what
platform they're developing their newest programs for, and WHY..
and then tell us what terrible businessmen they must be.

By the way.. you seem to have definate ideas as to how people
who try to support Atari with their lives and families should
conduct their business... can you tell us just what part of
your income is from your efforts to support Atari..?

If David Baggett is a lousy businessman for not *demanding*
that Atari talk to him on *his* terms, and Double Click are
"responsible for their own demise", then tell us.. just how
are you able to make a living in the Atari marketplace..?

BobR

(I don't actually expect that you'll read all this.. and fully
expect some kind of "what's yur problemz with Atari, eh?"
response... but it's fun to poke you now and then..)

7083. Re: Falcon030 -- Truth not Fiction

Newsgroup: comp.sys.atari.st
Date: 1992-12-22 08:49:08 UTC
From: dmb@case.ai.mit.edu
Message-ID: <1h6kq4INNsuc@life.ai.mit.edu>
Source record: 213096

In article <1h5ppkINNp78@usenet.INS.CWRU.Edu> aa399@cleveland.Freenet.Edu (Len Stys) writes:
>IS the Falcon030 with a Motorola 68030 16 MHz CPU powerful enough
>to produce games that require scaling, rotation, scrolling, and 3-D imaging?
>I'm talking WITHOUT a blitter and DSP chip.

In some video modes, yes. In others, no. It's probably fast enough to handle any of the 320x200 modes.

>How much slower would a game such as "Sonic" run in TRUE color video
>vs. 256 color video?

This raises an interesting point. You couldn't write a faithful Sonic the Hedgehog for the Falcon, because Sonic relies heavily on the Sega's hardware support for multiple scrolling planes. Put simply, you can have two "screens" that are overlapped and can be scrolled at different rates.

A DSP won't help you do that kind of thing. The blitter could help, but probably not enough to make such things doable with a 16Mhz '030.

This is an example of why Atari needed to put a graphics coprocessor like the TI34010 on board. Had they done that, the machine might actually be competitive in the games market (though more as a game console than a computer).

Fortunately for any would-be Sonic writers, the game runs in 320x200 (or the overlaced derivative; I'm not sure if they overlace it).

>How many people believe that 4 Megabytes should be the lowest amount
>of memory Atari should include with the Falcon030?

I vote for 4 megs as the minimum.

>Also explain WHY you believe it should be sold with this minimum
>instead of the others.

You should be able to do double-buffered animation in the 640x480 "true color" mode. This requires at least 2 megs; 4 megs for heavy-duty stuff.

>Should the Falcon030 have had a graphics coprocessor in it?

Yes, a 34010 or 34020. The companion floating point unit might be handy too. (Gotta love having a SPLINE opcode in your instruction set.)

>How much of an advantage would the Falcon030 have with a graphics
>coprocessor in video games?

A *real* graphics coprocessor would make 90's games *possible*. Things like Steel Talons, Virtua Racing, and even Sonic the Hedgehog require hardware support. The 340x0 series have hardware for drawing lines, copying screen regions (= sprites), etc. The situation is similar to that of virutal memory: you can do it without hardware support, but you wouldn't want to, and it would be really slow. I don't care how fast your DSP chip is; you're still going to have to write code for Bresenham lines. With a 34010 you'd just load a few registers and then do a LINE instruction.

Consider that the late 80's tank game Assault had at least one 34010 in it to do the rotation and scaling. (Rumor has it that there are two in there, but I'm not sure if that's correct.)

>There is a rumor that the Jaguar will be similar to the Falcon030
>with a Motorola 68030 16 MHz CPU, but with a 64-bit graphics coprocessor.
>How many of you believe that this could be possible. Why or why not?

Possible? Anything's possible. I have my doubts about the existance of this mythical beast, but "a 64-bit graphics corprocessor" is not hard to imagine. If they're designing a custom chip when there are already awesome off-the-shelf parts, though, I think they're being very foolish.

>If it was possible for Atari to redesign the Falcon030 and incorporate
>this graphics processor and then slip it into the production line
>in the middle of next year, do you think it would be a good idea,
>why or why not?

Yes, they might actually have a prayer if they put a graphics coprocessor (not just a silly blitter) in there and marketed a game console version of it. (If they could get the game companies to write titles for it, of course.)

>How many of you feel that a graphics coprocessor is so important to
>the success of the Falcon030 that it would be worth delaying the machine
>another 2 months to include one?

I doubt they could pull that off in 2 months since they've made the Falcon a closed architecture (sorry), but if they can, they should.

>How many people believe that Atari should concentrate on music with
>the Falcon030?

They better do something; they're rapdily losing their MIDI market to the Mac and PC. (For which top-of-the-line music software is still being written.)

>How many people believe that Atari should concentrate on entertainment
>with the Falcon030?

I do. But I submit that Atari should drop out of the computer market entirely and focus on game consoles, for three reasons:

1. It's the only thing they can do right, historically speaking.
2. There's more money in the console games market than in the home computer market.
3. The Atari name has been so defiled that it is now a joke in the computer industry. It does, however, still carry weight in the home video games market in the minds of the moms and pops out there who will be buying Junior a game console. Game consoles don't require a "company you trust" backing them up like computers do.

>How many people believe that the Falcon030 will be WAY underpowered
>as a home computer in Fall, 1993? And why?

It's way underpowered NOW. Comparison shoppers will look at "16" vs. "66" and "50" and "33" and laugh. Programs expand to fill all available memory and CPU cycles. Today's "perfectly good" applications are tomorrow's "pitifully underpowered" or "difficult to use" applications.

>How many people feel that they will be using a Falcon030 in 1995?

Question: How many people feel that Atari will exist in 1995?

>What is your greatest disappointment with the Falcon030?

It is 2-3 years too late, and it is yet ANOTHER Atari machine that is a bitch to write games for because it doesn't have the CPU power to drive its best games modes.

>What do you think is the greatest advantage that the Falcon030
>has?

A collection of rabid fans who will buy whatever comes out of Atari, regardless of its quality.

>Are you going to buy a Falcon030?
>
>If not, WHY?

"Yesterday's hardware at today's prices."

>Do you have a Falcon030 computer already?

No, but I pretend to use one on TV. :)

Odisseas Kosmatos lists lots of "reasons" why PCs are the
Scum of the Earth..

Sure.. but can your Falcon do *anything*...?

Without software, you've got a high-tech (and expensive)
paperweight..

Meanwhile, that poor, misguided PC owner is happily computing
using his lousy, clunky, "everyone knows" has problems PC to
do exactly what he wants it to do.

He had to pay $89 more to get 11 voice FM synthesis music, with
VOC sampled voice support.. so what..? It works.. NOW..

He had to pay $19 more to get a mouse.. so what..? It works..
NOW...

He's got an IDE drive.. so what? That's what the Falcon has too!

The point that seems to be universally missed here is that if
someone decides that they want to use a computer *NOW*, instead
of waiting for the ever present Atari "RSN", they CAN do it..

If someone decides they want to get some actual work done NOW
instead of waiting continually for the NEXT broken promise,
why shouldn't they..?

Why wait forever for the "ultimate" pie in the sky dream, when
you can get a REAL computer NOW..?

(OK, maybe some of us can afford to wait forever for Atari to get
their act together.. maybe someday they'll actually come up with
a killer machine that *everybody* just HAS to HAVE... but until
then, why spite yourself just to make Atari feel good...????)

Well as it happens I have bought the Xtra Ram deluxe ram upgrade too.
But I have had some problems with it. THe first problem was that the
MMU adaptor wouldn't fit. Well finally it would fit, but at that time I
had already damaged the MMU-socket. Well I went back to the shop where
I had bought my Xtra Ram deluxe (Data Skip in Tilburg, the Netherlands)
and they repaired the socket completely free of charge (actually they
just put in a new socket). But the upgrade still wouldn;t work. The
problem was in my ST that refused 0.5 meg in bank 1 and 2 meg in bank 2
(or 0 and 1 if you like that better) with 2 banks of 2 meg or the other
way around it would work, but it took a lot of time to find that out.
So just so you know when installing. The problem really was that
the disabling of one of the banks did not work very well. Sometimes the
ST still seemed to see the old 512 Kbytes. I have no clue why this is
but everything works GREAT now.
SO I recommend Xtra Ram Deluxe too!

Erlend.

Hey, so I could use the falcon to make direct digital copies of DAT
tapes??? And of compact disks??? Without the problem of the copy
protection??? Sounds *great* then I would finally be able to make my
own compilation of best songs on tape!!! And copies of it for my
friends of course. Yes it is illegal to give them to my friends but I
hate it that I cannot even make more than one copy for my own use, so
that is totally absurd!

Dave one thing Atari should have done was to produce the 'Mindset'
I did read that Atari did have a option on it..??

Also there is this Great U.K Computer called the Archemides
by Acorn, its a Risc machine, there risc chips are being use in the Apple
Newton...

Sort of leaves the A1200 for dead and the Falcon here, mainly on price,
comes with a lot of software built in, has a 2 meg byte Rom, uses a 10 sector
1.4 meg disk, giving 1.6 megs, uses IDE Hard Drives, PC type keyboard, but
there are lower grade models like the ST, and they come with a monitor, the Top
model (A540) has Svga, plus 1152 * 900 mono, the lower ones
are 640 * 480 256 colours...

There notepad called the A4 was in Byte some months back, they stated that
Acorn had the first multi-tasking windowing machines...

I understand your narrow-minded point of view, and cannot flat out say
it is a load of rubbish, but let's not get off the original topic, which
was that the Falcon has nothing going for it. I've shown at least twice
my reasons for why I think so, and we've seen your opposite reasoning too.

The original point was that the $799 PC was not much of a performer,
and that you would have to spend more money to get it to do
anything, whenever the need arose.

>AND the not inconsequential benefit of wonderful software support
>from developers who are *happy* to be in the market.

You may well be able to claim that there are excellent operating
systems for PCs, no problem so far. However, MS DOS, Windows,
Windows NoThanx etc. are not among them. Regarding Macs, if you
say their OS is smooth you must have taken a very superficial
look at it. I agree, the OS "looks and feels" rather neat, but
beyond that surface there are nightmares and loads of weird stuff
buried. Beware.
Also, remember that there are a lot of different things pepole
may want to do with their computer. If someone just wants to run
a word processor, a spreadsheet and a graphics program, he can do
that on a PC running Windows or on a Mac, despite all the horrors
buried in them. Even more, a Mac or PC may actually suit such a
person's need better than an Atari. But if someone wants to do
some programming too, he will probably be much better off with an
Atari.

What I'd like to point out is, there are problems with all
systems you can get right now, with Ataris, PCs Macs, Amigas
etc.etc. That's what life is like. Each system has its strengths,
and each has its weaknesses. There's no point in making generals
statements about how great or how rotten the Atari computers are.
They have their problems and they have their merits, and there
are enough advantages Ataris have over other systems to justify
the claim that one can't move to another system without taking
any sacrifices unless he moves to a system that belongs to
another league price-wise and performance-wise altogether.

Does anyone know if Megamax still exist, and if they are still
supporting the Laser C compiler?

I bought this a few years ago and the last update I have is V2.1
with the 1.0 Laser debugger. I still use it a lot as it is a
great environment, but no-one in the UK seems to offer support
any more... what happened?

If Megamax ARE still there, will it be ported to the Falcon? :-)

Thanx,

Keith.

Well, I assume that this doesn't apply to all the non-tech questions...

>And WHY did Atari make the Blitter faster?

Progress???
>
>I was told that since the DSP can only transfer information at the
>rate of 1 Mb/sec, it would not help much. Is this true?

I don't program scrolling, scaling/rotation type stuff, but I would kill for an independent processor in the game I'm working on; that processor doesn't necessarily need to transfer huge amounts of data to be useful- If I could just pass it a small amount of data and then after a short time (during which the main proc was chugging along on something else) have it pass me back some sort of result, I would be a _really_ happy camper.
>
>How many people believe that 4 Megabytes should be the lowest amount
>of memory Atari should include with the Falcon030?

I think I'll say 'Aye' to this. 1 or 2 MB is certainly enough for many good things, but memory isn't expensive so let's not be cheap about it; Atari needs to kill any reasons anyone might have for looking down on their product, no matter how stupid or tiny those reasons might be. Let's generate a bit of class by having a competent basic configuration. From another view, if they want to sell non-HD versions, having 4 MB and a bundled RAMdisk would be a good combination. My STe has no HD, but being able to use HSC (or other stuff) out of a sizeable RAMdisk at least lets me work fairly quickly once everything is transferred at the start.

>Should the Falcon030 have had a graphics coprocessor in it?

Given the choice between a graphics co-proc and DSP, I think they made the right choice. Both would probably drive the price out of my range (actually it already is :-)

>How many people believe that Atari should concentrate on music with
>the Falcon030?

'Aye'...not good to leave your main market. Without music, Atari dies.

>How many people believe that Atari should concentrate on entertainment
>with the Falcon030?

No. Entertainment will follow on it's own, although it wouldn't be a
bad idea to take a few steps (SUCH AS BUNDLING GW WITH DEVELOPER
PACKAGES OR MAKING IT AVAILABLE! THIS WOULD BE A SMART MOVE, ARE
YOU LISTENING, ATARI? I'm sure Dave and Neil would accept your apology.)
to cultivate some support from outside.

>
>How many of you believe that Atari's present keyboard in the Falcon030
>should be replaced with a better quality keyboard?

'Aye', see my reasoning above about class and basic configurations. A
cheap keyboard shows a lack of refinement IMHO.

>If you were Atari, how would you market this computer?

Advertise heavily in music and publishing mags, advertise what you can
in large-circulation mags (to generate general exposure), and let's see
some stuff in BYTE on a consistent basis. Then, advertise fairly big in
all those magazines that people who are starting to think about getting
a computer look at. Then bundle as much software as you can with all units,
to make it easy on people who are just getting started; it probably wouldn't
be a bad thing to include some of the best shareware from the ST world,
either. My STe came with nothing, and the manual was an ST manual, for
crimeny's sake! If I weren't an ST user already, I would have been
seriously turned off. Don't let this sort of thing happen, Atari- make
it as friendly as possible right from the start! This is really stupid,
I know, but I think it counts: some consumer mag, in their home computer
section of their yearly buying guide, gave the STe a so-so report, largely
because it came so bare-bones. Well, I'll bet they lost at least a few
sales because of that very review. Let's have some class! It can't be
that expensive to ship each unit with 5 or 10 disks, or with 10 or 20
megs of hard drive space used!

7105. Big bad BobR

Newsgroup: comp.sys.atari.st
Date: 1992-12-22 16:12:15 UTC
From: SML108@psuvm.psu.edu
Message-ID: <92357.111215SML108@psuvm.psu.edu>
Source record: 213205

Bob, what you say about Atari the company is true. The Tramiels are bunch of idiotic geeks, Atari would be a number one company if it didn't have the management problems it is experiencing (as would Commodore), Dave Bagget was utterly screwed by Atari and I cannot believe the *morons* who think what happened to him was his fault, and finally, I don't think that the Falcon will be a very successful computer nor will any of the new Amigas.

However, there comes a point when you just walk away and forget about fights you *CANNOT* win. You will not be able to change atari, they're very happy with the way they are and will remain that way for many years. They are *not* going out of business any time soon (nor is commodore) because of their European market. When you post here, you are either preaching to the choir in my case when you slam atari or you are yelling at the equivalent of atari drug addicts who cannot believe atari can do wrong. Give it up, buy yourself a PC or a mac and be *HAPPY*... Atari is not worth a heart attack...

I myself don't give a flying you-know-what about software availability for the ST. Spectre will be converted to it so it will have the mac software library for many years to come. And I utterly refuse to buy a PC until they pack them standard with a real memory mapped graphics board or SGI like graphics co-processor, and a real soundboard. It's been 10 years since those things were developed and all they have managed to do is up the processor speed and memory capacity and the graphics rez. BFD...
They still suck and will probably remain that way for some time... Middle class america might be happy with such schlock but I wouldn't be...

This means that despite my *MANY* misgivings with Atari and Commodore my next computer will be an Amiga or a Falcon unless someone comes out with something else. A 32 MHz board in the Falcon would make me a very happy man... After watching a slew of European demos last night, I realized why I will never buy a PC. You will never see the graphics in those things on the PC in anytime soon... I'm sure there are equally if not more impressive pieces of work on the Amiga. Finally, Bill Gates is a weenie, remains a weenie, and most likely always will be a weenie (a rich weenie though). he doesn't need my money...

Scott

>FPU has to be used by the software, otherwise it's utterly
>useless. But if the software using the FPU ist the OS itself, the
>addition of an FPU can very well lead to a general speedup.

A FPU like the 68881/68882 does what the name says, i.e. floating point (number crunching to you) calculations. Now what does an OS do? It manages directories, files etc, all pretty mundane stuff, and all character or integer - based. So if the OS doesn't do floating point calculations (and lots of them) them you won't get any speed up.

So what sort of things would benefit from a FPU? Well, 3D graphics (where you need to calculate trig functions which are a LOT faster with the FPU), CAD packages and the like. Unless you are interested in these sort of things (I am), then a 68881/2 is a waste of money.

Keith.

I am looking to upgrade my Mega2 ST to 4 megs ram and a faster cpu.
I am thinking of getting the 030 cpu. I would appreciate it if you could
lend any information about where I can get the above items and at what
prices. (Used is okay also.)

Thanks in advance!

7109. Re: Falcon030 -- Truth not Fiction

Newsgroup: comp.sys.atari.st
Date: 1992-12-22 17:14:32 UTC
From: chang@adelphi-assb01.army.mil
Message-ID: <9212221706.AA28368@adelphi-assb01.army.mil>
Source record: 213208

>Are you going to buy a Falcon030?
>
>If so, WHY?
>
>If not, WHY?

Maybe, depends primarily on the direct to disk multitracking
ability, secondly on graphics and desktop video.

If the rumors turn out to be true that the 8 track direct to
disk will be a couple hundred bux, we might have something here.

The alesis ADAT -- modular, SVHS based digital multitrack recorder
is the rage and also next on my expensive toy list. It lists for about
$4K and lowest price I've heard was $3K. I'll spare those people not
interested in recording the details, but it's kicking, and very modular
(need 8 more tracks, add another adat).

Well, if I can buy a falcon for 1200 dollars or so (gotta have
more than 1 meg and a HD) and the 8 track attachment for say $400,
a huge HD for $800 and a tape drive to store the songs on say $300, lets
say I'll have spent $2700 -- pretty close to adat.

Hmm... well if I can chain together multiple falcons for up to
128 tracks (which what the adat is capable with the BRC -- another $2K
tho') then I have the side benefits of running my ST software.

Since atari is looking at niche market, esp. music/midi it would
be a good move to take market an "alesis adat killer" (I actually like
this company not and laud it's service and products -- but as far as
digital multitracking they are current the people to beat.)

Take the thing out of the carpal tunnel syndrome inducing (ask
me about it), non ergonomic, looks like a game machine, isn't really
all that much more portable for those midi musicians on the move, box
and place it in a rack mountable box which includes a HUGE HD for
multitracking and a tape drive to back up your precious work.

Then make an optional keyboard about the size and config of
the apple power book, i.e. small functional keyboard with the track
ball attached. Then with a long cord or better yet an infrared remote
on the keyboard you can control everything from the various locations.
I've got a 1040 as my sequencer/smpte chaser. I have to constantly get
up from my various equipment/racks and go to type on the the non detachable
keyboard. I use a cordless mouse to help so I can operate parts of the
the sequencer, but still it's not too convenient.

With this we could have a true professional music recording workstation..

1) rack mountable -- goes in the rack w/ the rest of the music equipment. And were I to take in on the road with me, you put it in a rack case.
2) functional portable keyboard -- control of everything from any place in the room.
3) central control of virtually everything in one unit.

Midi and D2D this can control the bulk of what's being recorded, disk for analog signals, midi for synths, effects. Pep up the machine and you could probably display animation at the same time -- you could make a whole video on one machine..

If someone can make this for the same price as an alesis ADAT, then you've got something. Esp. if they were to make slave rack mount devices to be controlled by the master one for modular addition of digital tracks. These slave boxes you could probably make for the $700 falcon box, no keyboard, no peripherals expept i/o to the master and disks.

If atari could make this, studios and musicians alike would snatch the thing up, like they are with the ADAT, but in this case it would be more flexible and and cost less to come up with a 128 track digital studio.

Provided that it is still in business next year. Also provided that you don't take the 'upgrade' route and pay $185 for a 386 motherboard to stick into your AT clone machine. (This applies only to the PC market. Apple still supports their own machines, although any dealer will tell you that if you are still using a Mac 512KE/Plus/SE you should 'upgrade' by purchasing a new machine).

>AND the not inconsequential benefit of wonderful software support
>from developers who are *happy* to be in the market.

Generally for a price. Borland, for example, will be more than happy to support their software over the phone for $2.00/minute. Shareware authors are a bit easier to get hold of, but it is no more difficult to get answers from ST shareware developers than for the PC/Apple markets.

>If David decided to bulk-erase his masters of the Game Workbench
>and say "screw Atari", I wouldn't be surprised.

Of course it would have to be a joint decision between him and Neil. And it wasn't Atari that screwed David -- if you want to point the finger of blame at the people MOST reponsible for the non-release of Game Workbench, point it at Double-Click Software.

Actually, I did. I've used PCs, Macs, NeXTs, HP & Sun Unix boxen, etc.
I do programming, tutoring, or system installation or whatever anyone
wants to pay me for on just about any system... It may be a variable
income, but it's given me a lot of exposure to different systems.

The sound support on the PCs is pathetic. A tinny little speaker on
most of them, and then the rich ones have either non-standard ones that
are supported by perhaps 3 applications or they have a SB, which has a
slightly larger stable, but not by much - and it has some major
limitations. No way. The OS's on the PC are even worse - I might
consider a 386/486 Unix box, but that costs as much as a NeXT, and the
NeXT is better integrated... The Mac is the most incompatible thing I've
ever had the misfortune to use. I came > < THIS close to buying one, at
one point, but I ran far far away after working with them.

Ditto for the Unix systems - for the price range I can afford, there's
nothing worth buying... I've got a very open mind on this, but I will
NOT accept a crippled computer.

> I see.. you're "stuck" with Atari, so you're going to badmouth
> anything else there might be..
> By the way, you must be new here.. go back and actually READ
> the things I've posted. Find where I said I don't like my ST..
> please...

I'm hardly badmouthing everything else - just providing my honest view.
If you can live with their limitations and annoyances, then that's your
own situation - but I suspect most ST owners can't.

As for your liking or not liking the ST, I never said you didn't - but
you certainly don't seem to notice the defects the others have (and while

the ST does have a few of its own defects, mainly the difficulty in multitasking - MiNT is spiffy, but I like running multiple GEM programs, and MultiGEM dislikes NeoDesk <sigh>, they're not particularly crippling defects, as with the Mac and PC...)

> >In the meantime, don't bullshit at newbies...
> I might suggest you do the same.. don't lie to them..
> don't tell them everything is rosy in the world of Atariland..
> don't tell them that people like David Baggett will always be
> around, no matter what abuse Atari Corp may dish out to them.

It's hardly rosy. I just don't think it's the end of the world (and it seems to me that I've heard exactly the same kind of "Atari Will Die" predictions for the past 7 years. Heck, even before that with the 8-bit..) Atari is a small company, and will probably always be on the edge of completely losing it all... And so far they've managed to avoid going completely over the edge, and I suspect they will for a long time to come. While I despise their corp policies, and their horrid lack of advertising, and the platitudes they give out to cover over it, that doesn't change the fact that it's the only computer and software that really works properly at anywhere near its price.

> If David decided to bulk-erase his masters of the Game Workbench
> and say "screw Atari", I wouldn't be surprised.

Given Dave's Type-A personality, it's always a possibility <grin>, but I have a hard time seeing any programmer destroy code... He may move on to other platforms, but he'll probably release the GW for the ST, and I suspect he'll keep coding for it.

> you're stuck with Atari, come hell or high water, and you have
> You may consider the truth to be "garbage", but then again,
> to reconcile yourself to that. If the truth hurts, then maybe
> something's wrong with your slavish devotion to the company..?
> Ever give that any thought..?

It's hardly devotion to Atari Corp, Bob. Don't spew more garbage, eh/ What you're giving out isn't "Truth". It's just your opinions, just as this post is just my opinions...

As I've indicated, if I had lots of money, I'd probably be hacking some other machine, probably a NeXT or a Unix box. But I don't, and neither do a lot of other people. Telling them that a PC is a better platform is just garbage, because it's not...

>So.. your real world experience in dealing with medical
>software companies has absolutely nothing at all to do with
>dealing with Atari Corp.

Bullshit. How one engages in business is applicable across the board, whether the company you're dealing with wants to succeed or (in your estimation) whether they want to fail. I don't NEED to deal with Atari Corporation in order to know what standards I set for myself with regard to business meetings. I don't NEED to personally deal with Atari Corporation in order to know that if I don't have a clear set of goals going into a business meeting, I am surely not going to come out of that meeting having met any goals. I don't NEED to deal with Atari Corporation to have enough sense to ask for an agenda and a list of the people with whom I am going to meet.

Your suggestion that one has to have dealt directly with Atari before one is capable of issuing any judgement upon practical business tactics is ludicrous.

Your assertion that until I have actually dealt with Atari I am in no position to state how I WOULD deal with Atari is yet another example of the extent your apparent PERSONAL hatred for that particular corporation extends.

In article <72176@cup.portal.com>, Bob_BobR_Retelle@cup.portal.com writes:

WEll, it was amusing the first fifty times he's said it, but it's getting less and less amusing.

For the record:

I do not produce software or hardware for the Atari ST. I *have* several software projects I'd like to do, but working 70+ hours a week does not leave me with time to sit down and write the programs. I *do* support Atari ST users through our local user group, and have done so consistently for the past six years. I maintain an ST-oriented DOM library, and have been an officer in the local user group for five years. I was the newsletter editor for the group for several years as well. I purchased a 1040ST in September 1986, and a Mega4 ST in March of 1989. I wrote a series of articles on programming in OSS Personal Pascal, back when it was still a viable language.

I've been doing my share to support Atari ST =users= for quite some time now, even though I don't happen to take money for my services.

I have owned my own computer-software business. It did well enough to get me through graduate school. Over the years, I've had my share of meetings and interviews with clients. I feel that experience can be transferred to any sort of business meetings I might have in the future. I know how to conduct myself with troublesome clients, how to set up an agenda for a business meeting, how to discern when a meeting is not going to be fruitful, and when to walk away.

I don't recommend Atari computers to everyone I meet. I don't think about the Tramiel family on a daily basis. I don't have a reason to hate Atari Corporation, nor a reason to love Atari Corporation. I feel comfortable using their computers. Once my house is built, I plan on purchasing a Falcon, not from any loyalty to Atari Corporation, but because I know what to expect from their computer systems. I also know what else is available -- currently I have access to most of the Macintosh line (with the exception of the Quadra), as well as to standard 486DX-33 Intel machines with $800 monitors. Not to mention the minicomputers and workstations we have which run circles around the smaller micros. I even have a copy of the book _Build_Your_Own_486/486SX_and_Save_ _a_Bundle_.

It's a pity that Michael Vederman couldn't keep Double-Click together. Then again, there is more to the non-release of GW than a single visit to Sunnyvale. DC was operated by several folks, and unless one of them wants to speak up about the turmoils within the business (for which I only have rumors which I won't repeat), we'll never know the entire story.

I upgraded to V2.1 about a year ago. The number didn't even give the name Megamax, but the name of another company. I ordered my upgrade and he said it would take a week. After two weeks went by I started calling them but all I got was an answering machine. I left several messages, then it occurred to me that perhaps he misplaced my address so I left my address on the last message and received my upgrade a few days later. It didn't sound like further upgrades are in the works.

Have you gotten Laser C to make under gulam? I wasn't able to get Megamax's environment variables initialized, but I didn't work on it too much.

>Dave Bagget was utterly screwed by Atari and I cannot believe the *morons* who
>think what happened to him was his fault

For the record:

Dave Baggett was not 'utterly screwed' by Atari. He was treated unprofessionally. Nothing "happened to him" which may be construed to be his own fault, with the exception of the handling of the media which they brought to demonstrate (this assuming that I correctly read his first posting about the setup on his Syquest cartridge).

I have my own opinion on how such a meeting *should have been* arranged, and have stated those opinions. Much of that opinion was based upon the presumption that Double-Click sought the interview with little more than the idea of showing Atari what Game Workbench could do, which is what the initial postings appeared to state.

Dave Baggett was also bound by a contract with a software house which apparently did not have the resources remaining to produce the software in a timely manner. I own several of Double-Click's products, and would not have thought that there were problems over the past year, given their advertising and announcements about the soon-to-be-released Game Workbench.

I think that blame for the non-release of Game Workbench is misdirected at Atari Corporation. It certainly cannot be directed at Dave Baggett.

>and finally, I don't think that the Falcon will be a very successful computer
>nor will any of the new Amigas.

If by success you mean "millions sold here", I will agree. Then again, I don't think that any of the current computer systems will ever be truly integrated into every household either. I'd certainly watch Phillips' attempts at entering the Interactive CD market -- after all, consumer machines are what people purchase. (There are more game consoles in homes than computer systems.)

Message-ID: <9212221908.AA05902@floyd.cca.cr.rockwell.com>
Source record: 213338
Cross-posted to: comp.sys.amiga.marketplace,misc.forsale.computers,comp.sys.atari.st,misc.computers.forsale.other,misc.computers.forsale.pc-clone

I have received about a 1/2 dozen positive responses to my original
request for computer equipment for Isaac Newton Christian Academy
(a non-profit private school located in Cedar Rapids).

We are going to be getting:

- Misc. hardware/software items for both IBM clones
and Apples including:

- 1meg ram board for Apple
- generic EGA card for IBM clone
- 1200 baud modem

- A complete Panasonic XT clone system + software
- A complete Epson QX-10 CP/M system + software
- An Amiga 2000 system minus the 3-1/2 floppy and monitor
but does include:

- 40meg harddrive
- XT Bridgeboard

If anyone has any misc. items that they could donate, here are some
specific needs (but we'll put to use almost anything):

- EGA card/monitor display for IBM clone
- Hercules monochrome card/monitor in lieu of an EGA
card/monitor
- Amiga color monitor
- Amiga 3-1/2 floppy drive
- Educational/Application software for Amiga

Thank you... and keep those donations coming. My goal is to have 12
complete functioning computers by the 1993 Fall semester... we now have 4.

Contact me via email at "barothwe@floyd.cca.cr.rockwell.com"
and I will give the school's address!

Later,

7121. Internals of an ST keyboard

Newsgroup: comp.sys.atari.st
Date: 1992-12-22 20:46:16 UTC
From: geoffc@zebedee.uucp
Message-ID: <H.q&CXAby59KY@zebedee.uucp>
Source record: 213234

Help !

I've had a problem with the '*' key on the keypad of my ST whereby the keytop snapped off (ie: the leg that the keytop is part of snapped). I made the fatal mistake of gluing the keytop leg back together without taking the rest of the keyboard appart - the result of this was that I glued the key solidly in place !

I then dismanteled the keyboard, unstuck the key and cut away the plastic so that the key mechanism worked properly. The problem is that when I came to put the keyboard together afterwards I discovered that I was one little rubber 'bit' missing. The piece I am missing is about 1cm accross and contains a small graphite block which makes the contact on the PCB.

In cross section it looks like this:

```
ttttttttt
t KKK t
KKK
KKKKKKK
KKKKKKK
/X\
/ \
-------------------------------------PCB
```

where the ttt bit is the keytop and the KKKK bit is the key leg. The rubber bit I am missing is the /X\ bit above.

Does anyone have any of these (or the whole key mechanism) (eg: from a defunct ST they may have lying around) ? Any help gratefully received as I am having to push a screwdriver through the hole in the keyboard to make contact below whenever I want to use the '*' on the keypad (which I need quite a lot as it is 'escape function' when connected to the computer at work).

Thanks

Geoffrey

aa399@cleveland.Freenet.Edu (Len Stys) writes:
>First of all, I'm told that 640x480 TRUE COLOR would require 4 Megs
>of memory for NICE games. I'm told that 2 Megs would not really be
>enough since there must be room for other stuff like sound.

Except that the falcon only allows 3 memory configurations. 1M, 4M, and
14M. You can't have only 2M of memory.

>Secondly, no one seems to know if this resolution (interlaced of course)
>could be displayed on TV without flicker. Does anyone know?

If this is interlaced, it SHOULD work, it'll have SOME flicker, but TV's use
slow phosphor, so it won't be as noticable on a TV as a monitor.

>Thirdly, I have talked with someone that said that 640x200 (I'm not sure
>if you can get true color in this resolution) would also produce some
>pretty good games. I guess that could be pushed to 640x240, but
>anyways, I'm told that 300k for ONE screen. And you'll need at least
>TWO screens. This would allow this game to produce with only 2 Megs
>easily--MAYBE even 1 Meg.

Again, there is no 2 meg configuration. Though 640x400 should give too much
display contention to get good frame speed, 640x200 might be usable.

>I have been also informed that the Blitter REALLY would not be fast
>enough to move graphics around. And someone suggested that Atari should
>have used the TI30410. My question is, would the DSP work just as well?
>The Atari Advantage article states these things:

It's probably fast enough to do simple graphic moves, but nothing complex.
The DSP doesn't really have the "oomph" to pretend to be a blitter.

>Image management: Shapes, sizes, contours, shading, highlights
>Vector manipulation; grahics "engines"
>CAD/CAM workstations' 3-D image generators
>Flight (and other transportation) simulators; arts and film sequences
>
>If anyone knows anything about the 56001 DSP, please join in and
>say something!

I've seen posts from people that work for Motorola and know EXACTLY what the
56001 can do. They tell me the 56001 is not powerful, or precise enough to do
large graphical computations. The 96001 is supposed to be much better for
this. In any case, you lose the DSP to do audio things if you attempt to do
graphics with it.

>Will the DSP be able to produce CD quality sound AND generate graphics
>in a game?

The DSP doesn't give you the sound, the DAC's do, however, i'm sure the DSP feeds the DAC's so you will probably lose your sound.

>What is the 32Kx24 bit (96K bytes) of local zero wait state SRAM for?
>What does the DSP do with it?

Well, it's program and data have to be stored somewhere..

>And lastly, the Jaguar is rumored to run off of a RISC 64-bit chip.
>We don't know what type of chip this is.
>
>Could the Jaguar POSSIBLY be a Motorola 68030 at 16 MHz and have a
>RISC DSP?

Well, knowing Atari's penchant for being dishonest, and alluding to things that aren't so, I'd say it's a possibility, but, for those that buy a jaguar (if it ever sees the light of day) I hope not. That would be one SLOW game system.

>that is totally absurd!

You sure could do this, but what kind of media would you record onto? At
around 760 MB for a 76 minute CD, you're probably not going to be making
a lot of digital copies on your hard drives, anyway. You'd have to just
record back onto a DAT, or maybe onto an Exabyte drive. Of course, it still
may be a good idea to send the digital straight into the Falcon, and have
the Falcon remove the copy-protection bits, then feed into your DAT...

>
>How many people believe that Atari should concentrate on entertainment
>with the Falcon030?

They would be insane to! :-)
Seriously, I don't believe entertainment is a viable concentration market for a computer. To be successful in this market would require a SERIOUS marketing effort aimed at Saturday mornings and weekday afternoons on TV when all the kids would see it, decide they can't live without it, and whine at Mommy and Daddy until they get it. Even this might not help, considering the huge market share and Draconian marketing practices of Nintendo.

>
>How many people believe that Atari should concentrate on multi-media
>with the Falcon030?

Good idea. With Kodak on board, Atari has a good chance here, provided they don't blow it (read: ADVERTISE!).

>
>How many of you believe that Atari's present keyboard in the Falcon030
>should be replaced with a better quality keyboard?

If it is the original ST keyboard (and it sure looks like one), YES.
One of the happiest days of my life was when I put aside my ST keyboard for a TT one.

>
>What do you think is the greatest advantage that the Falcon030
>has?

DSP.

>
>Do you think Atari will still have this advantage in 1994?

I don't know. All depends on how many other machines have one.

>
>If you were Atari, how would you market this computer?

I would market this computer :-).
Seriously, I'd go for print ads in major computer magazines, such as BYTE.
A couple of TV ads wouldn't hurt, either.

>
>Are you going to buy a Falcon030?

No. I bought a TT last year, and I'm not done with it yet.

The DSP is a sound processor, making the Falcon very attractive to
musicians. And Dave already told us how other machines had captivated
the graphics market.

>are however also higher resolutions in SuperVGA as well...

SOME Super-VGA. And SOME monitors.

From my limited experience, PC games don't use Super-VGA anyway.
Some "Applications" programs do however.

But hey, we've been forgetting that the Falcon has another graphics
mode - the 32768 colour mode, with overlay bit - allowing video
titling. Can't do that with your average Super-VGA.

All computers have to start somewhere, when the MS-Doze machines were released, just about all that was available for them, was the nice slow Operating System (PC-DOS or something similar it was called back then). and a couple of spread-sheets etc.

The Falcon is basically a new-beginning for Atari, and there is already a lot of software currently available that will work okay on the Falcon. (A lot won't, but that's the price you pay for advancement).

If the thing takes off, you can bet your a** that people *will* write software for the thing!

Comparing computers is a pointless waste of time, people will buy the computer which has the features that *they* are most interested in, or which will be of most use to them.

As someone so well stated previously, they are only computers anyway, it's not as if they were relations, or (as said) a religion!). Jset seen /thread

Wait for the Falcon, and then write an Am*ga 600, (or evern 1200) emulator.

Even with emulation slow-downs, the speed should be pretty close!
(Except if the a1200 has a 32Mhz... But the ST's disk drive is a LOT
faster than the amiga's so, speed is just about made up there 8-)

7135. ICD Fast Tape Backup unit For Sale

Newsgroup: comp.sys.atari.st
Date: 1992-12-23 02:38:47 UTC
From: jcochran@nyx.cs.du.edu
Message-ID: <1992Dec23.023847.26190@mnemosyne.cs.du.edu>
Source record: 213233

I apologize if this is the wrong newsgroup for a for sale post
(and if so, I'd appreciate email as to an appropriate group for this).

ICD Fast Tape Backup unit for the Atari St. Purchased in 1989 for
around $800. The unit works fine and is in good condition. I haven't
used it for about a year and a half or more -- since my hard drive died
(my main machine is now a 80486). 30-day money back guarantee. $200.

If interested, you can email me at:
jcochran@nyx.cs.du.edu

or call me at:
303-449-3315

Jim Cochrane

In case anyone is interested, some of the specs. from the manual
are listed below:

typical transfer rate: 6.5 MB/min.
average time for 155 Mb backup: less than 23 min.
recording format: 17 track serpentine
formatted capacity: 155.7 Mb per tape
write verify: full read after write and ecc
retries: write up to 15, read up to 16
tape speed: 90 ips (288.6 cm/sec)
maximum rewind time: 80 seconds (approx.)
MTBF: 10,000 POH
magnetic tape: ICD CT-600XLN, TEAC
CT-600N, Maxell
CS-600XDN or equivalent

>16-bit buses...
>
>-- David Paschall-Zimbel
>

Hey, hey...

I'll be first to admit that the Falcon030 even with a Motorola 68030 CPU
at 16 MHz is a good machine.

If Atari could produce say, 500,000 next year and sell them all over
the world, this would definitely work for the company.

But in the back of my mind, I'm afraid that ATARI will only produce
around 50,000 by November of next year.

And in the back of my mind, I'm afraid that ATARI will not advertise
anywhere about this system.

The problem isn't quite with the Falcon030, it is a good computer.
The problem is that the company producing them will need to REALLY
get off their butts and produce and market it.

That's what worries me.

And there is no doubt in my mind that a 16 MHz home computer will
be obsolete BY mid'94.

Can Atari really do anything with the system in less than a year?
I don't know.

>>Wow, a 386 clone is about as exciting as watching re-runs of "Designing Wom
>Tell me about yesterday's technology while you're at it...

3 lessons to be learned...

1. A processor is not the only thing that makes a good computer.
2. A 486/66Mhz does'nt necessarily mean 'loads of fun'
3. Yesterdays technology was only 24 hours ago. :-)

Very good points..!

Ok.. for a somewhat different discussion.. what exactly is it that
makes a computer "exciting"..?

Pattie Rayl doesn't like PCs because of the way they look. She
likes the looks of the Mac, so I guess that for her, the physical
appearance of a computer would be what is "exciting"..

A lot of people like to compare specifications.. is a 32 bit bus
better or worse than a 16 bit bus running with a CPU that can
implement "look ahead" caching.. in that respect, the internal
aspects of a computer are what are "exciting"..

Others are excited by what the computer can actually do in
"real world" applications..

The Falcon is "exciting" because it combines a lot of features
that are either "leading edge" or have the potential for unusual
applications.

A VAXcluster might even be "exciting" for some people because of the
idea of multitasking a lot of processes and the system resources associated
with a large system.

To me, a '386 clone IS exciting, because I can use it to play
Red Baron on the Sierra Network and shoot down (or get shot down
by) friends from all over the country, something that can't
be done with any other kind of computer at the moment.

So, what is it that makes a computer "exciting"...?

Jan Kim writes:

>Hmmm... the question is, isn't that "heck of a PC" just another
>instance of an "entry level machine"?

Yes.. thinking about how fast the PC market is moving, you're probably right that a '386SX with VGA or SVGA monitor, 2 High Density floppy drives and a 100+ Meg hard drive would probably be considered as an "Entry Level" system today.

Amen! Music was the reason I got my Atari in the first place, and music
is the reason I will get a Falcon (but wait for a 68040 version). It
sounds like a nice upgrade to me, being that I'm still happy with my
1040stf (I got it in '87 I think). And I work with Sun, SGI, etc.
including pcs (I'm sorry, but pcs turn me off), so my opinion is
not based on no exposure to different platforms.

And thank you Howard for providing the useful factual info about the
Falcon that you have provided.

David Paschall-Zimbel writes:

>Just a quick question here, Bob. What computer do you use most of the time?
>This includes those times you're online answering CompuServe questions about
>the Atari ST line...

Gotta wonder a little about the relevance of the question.. but
as David is so predictable, I can just hear the "must be personal
problems with Atari Corp" comments coming...

Well, the answer is.. it depends on what I want to do..
(the classic "decide what you want a computer to do before you
decide on what computer to get")

Right now my XT is re-compressing some GIF pictures, the PS/2
is waiting for me to get back to playing Eye of the Beholder II,
and my ST is busy composing this message.

When I want to display those GIFs, I'll use the VGA of the PS/2,
and when I want to program a little, I'll use the Hercules XT
system for its larger hard drive. Llamatron belongs to the ST..
I played it on the PS/2, and it truely sucks.

Then there's the mini-tower with its '286 motherboard and pieces
all over the room, waiting to be assembled. What it doesn't know
is that the '286 board will never be installed, since '386DX
boards have dropped in price so much. When that one is done,
I'll be able to play Ultima Underworld and the other games that
require the speed and memory.

CompuServe..? That belongs to the ST.. I still haven't found
a telecommunications program for any other computer platform
that works as well, or meets my needs like Flash does. In fact,
my ST is seldom ever turned off, since the capture buffer in
Flash usually holds a megabyte or more of online sessions from
all the boards and services I use. (The only exception is the
Sierra Network, which only works with PCs for the time being).

Oh.. and when I want to print out huge doc files, I use a VAX
8550 in a cluster of a dozen VAXes to use their high-speed
lineprinters..

But.. since most of my time is spent online somewhere, the
answer to the original question would have to be that I use my
ST more often than any of the others..

Any other questions..?

Gordon Farrell asks:

>What did Atari ever do to you to get you so rabid?

Basically, and essentially, Atari Corporation, under the management of the Tramiel family took a promising, leading-edge, fresh approach, user friendly, and very hopeful computer system, and for all intents and purposes, ruined it.

In the process, they also affected the lives and livelihoods of a lot of people who tried very hard to support the Atari computer line, a lot of whom were, and are, my friends.

Perhaps one of the worst things they've done, again and again, is to raise false hopes among those who still support them and their computers.

I've been involved with Atari computers since the Warner days, and I've supported Atari computer users all that time. I'll be among the last group out the door when they turn out the lights whenever that might be, too.

I like my 520ST best of all the computers I've owned over the years and use it daily. It makes me awfully sad to think of what it might have become, if only its parents had cared about it.

Scott, the realization that NO one is going to change anything about Atari hit some time ago.. most of what you see is more along the lines of trying to correct misconceptions or misrepresentations.. (ie:inexpensive PC motherboards are usually sold without CPUs)

Then again, it's fun to poke some people in the eye with their ignorance to watch them jump.

Incidentally, (not to start any flame-wars.. please!), a lot of those "European demo writers" have moved on to the PC platform. They're doing sound and graphics which used to be exclusively the domain of the ST and Amiga. You could disguise the monitor and not be able to tell them from the ST demos of years past.

Christopher, why do you use "OS/2> " as a quote string? I don't
think it's a good idea to use quote strings which are six (!)
characters long. It's an utterly useless waste of bandwidth, and
it considerably lowers the signal to noise ratio of your
postings, as those nonsense strings are 100% noise. Plus, if many
people developed such habits, line lengths would rapidly approach
infinity after being quoted for a few times...

In <9212222830@ritz.mordor.com> ritz@ritz.mordor.com (Christopher Mauritz) writes:

>Jan T. Kim (aeg03@rrz.uni-koeln.de) wrote:

>OS/2> Windows NoThanx etc. are not among them. Regarding Macs, if you
>OS/2> say their OS is smooth you must have taken a very superficial
>OS/2> look at it. I agree, the OS "looks and feels" rather neat, but
>OS/2> beyond that surface there are nightmares and loads of weird stuff
>OS/2> buried. Beware.

>More than TOS??? Hehe, let's get some perspective here. MacOS is
>a dream compared to the daggers you'll find hidden all over TOS.

A dream, maybe. A nightmare, to be more precise. At least, that's
what I call an OS which doesn't provide anything like a function
to save the desktop, but instead insists on presenting you with
the mess you left last time. I don't want an OS that will
suddenly ask me to insert a disk which I have forgotten about
since long. I hate to be constantly worried about large amounts
of data that may not yet have been written to disks and will be
lost should the system hang. On a more "expert" level, the weird
shuffling about and purging the Mac does with its resources is
utterly brain-damaged, and actually even worse than a garbage
collection on a C64. And so on and so on... this much may suffice
for now.

>OS/2> Also, remember that there are a lot of different things pepole
>OS/2> may want to do with their computer. If someone just wants to run
>OS/2> a word processor, a spreadsheet and a graphics program, he can do
>OS/2> that on a PC running Windows or on a Mac, despite all the horrors
>OS/2> buried in them. Even more, a Mac or PC may actually suit such a
>OS/2> person's need better than an Atari. But if someone wants to do
>OS/2> some programming too, he will probably be much better off with an
>OS/2> Atari.

>And use what development tools?

For me, GFA basic has worked well until now. Other than that,
there's Pure C, Pure pascal, gcc, g++...

From: Achim_Wilhelm@m4.maus.de
Message-ID: <A6622@M4.maus.de>
Source record: 213082

a>IS the Falcon030 with a Motorola 68030 16 MHz CPU powerful enough
a>to produce games that require scaling, rotation, scrolling, and 3-D imaging?
a>I'm talking WITHOUT a blitter and DSP chip.

My opinion: No.

a>Is the Falcon030 with a 68030 16 MHz CPU and Blitter 16 MHz powerful
a>enough to produce games that require scaling, rotation, scrolling, and
a>3-D imaging?

My opinion: Yes.

a>If so, what does the Blitter do to help? And how did Atari manage
a>to make the Blitter faster?

Fast bitblock-transfer. It's new designed and layouted. Old Blitter runs only
with 8 Mhz, the new Blitter with 16 MHz.

a>And WHY did Atari make the Blitter faster?

Because the old one was buggy. The removed the bugs, and because the FALCON
runs with 16 MHz, the blitter runs with 16 MHz, too.

a>Can the DSP help at ALL in video games such as flight simulators?

My opinion: Yes.

a>I was told that since the DSP can only transfer information at the
a>rate of 1 Mb/sec, it would not help much. Is this true?

No. I calculated a fraktal with CPU (38 seconds) and with DSP (8 seconds).
Iterations: 32. About 70x70 pixels.

a>How much slower would a game such as "Sonic" run in TRUE color video
a>vs. 256 color video?

I don't know.

a>How many people believe that 1 Megabyte should be the lowest amount
a>of memory Atari should include with the Falcon030?

Me not.

a>How many people believe that 2 Megabytes should be the lowest amount
a>of memory Atari should include with the Falcon030?

FALCON has only 1, 4 or 14 MBytes.

a>How many people believe that 4 Megabytes should be the lowest amount
a>of memory Atari should include with the Falcon030?

Me.

a>Also explain WHY you believe it should be sold with this minimum
a>instead of the others.

I think, 4 Megs should be the delivered minimum, because the graphics-memory
is about 200 kBytes on 256 colors. Multiplied by 2 for logical and physical
screenmemory makes abot 400 kBytes. Good sound (for DMA and CODEC) and good
graphics will cost about 300 kBytes of memory. So there will be not enough
memory for the game.

Other case: You do DTP or CAD. One Meg is really not enough.

Next case: You like MultiTOS (if it's available).

a>Should the Falcon030 have had a graphics coprocessor in it?

Why not?

a>How much of an advantage would the Falcon030 have with a graphics
a>coprocessor in video games?

I don't know.

a>How much of an advantage would the Falcon030 have with a graphics
a>coprocessor in video production?

I don't know.

a>There is a rumor that the Jaguar will be similar to the Falcon030
a>with a Motorola 68030 16 MHz CPU, but with a 64-bit graphics coprocessor.
a>How many of you believe that this could be possible. Why or why not?

??

a>If it was possible for Atari to redesign the Falcon030 and incorporate
a>this graphics processor and then slip it into the production line
a>in the middle of next year, do you think it would be a good idea,
a>why or why not?

No good idea. Better idea is to deliver a add-on-graphic-card for the expansion
slot. Normen Kowalewski from ATARI Germany gave us on the MausNet some rumors.

a>How many of you feel that a graphics coprocessor is so important to
a>the success of the Falcon030 that it would be worth delaying the machine
a>another 2 months to include one?

Me not. I bought one 4 days ago.

a>There will be flickering in interlace video mode on TV, how noticeable
a>will this be?

Very noticable. It's really awfull to work with this flickering.

a>Translation: Will it give you headaches if playing video games on TV
a> in interlace mode?

Shure.

a>How many people believe that Atari should concentrate on music with
a>the Falcon030?

Me.

a>How many people believe that Atari should concentrate on entertainment
a>with the Falcon030?

No comment.

a>How many people believe that Atari should concentrate on multi-media
a>with the Falcon030?

Me.

a>How many people believe that Atari should concentrate on video production
a>with the Falcon030?

No comment.

a>Is there any other market that you believe Atari should be going
a>after with the Falcon030?

No.

a>How many people believe that the Falcon030 will be WAY underpowered
a>as a home computer in Fall, 1993? And why?

Me not.

a>How many people believe that the Falcon030 will be WAY underpowered
a>as a home computer in Fall, 1994? And why?

No comment.

a>How many people feel that they will be using a Falcon030 in 1995?

Me.

a>How many of you believe that Atari's present keyboard in the Falcon030
a>should be replaced with a better quality keyboard?

ME!!

a>What is your greatest disappointment with the Falcon030?

No Comment.

a>What do you feel Atari should have included with the Falcon030
a>that they left out?

No idea.

a>What do you think is the greatest advantage that the Falcon030
a>has?

DSP and CODEC.

a>Do you think Atari will still have this advantage in 1994?

No.

a>Are you going to buy a Falcon030?

No.

a>If not, WHY?

I have one.

a>Do you have a Falcon030 computer already?

Yes. :-)

regards, Jimmy

I am using it with the UltraScript fonts I bought it with. I have printed
real complicated stuff with it without a hitch but at times simple text
printing causes the screen to go black and out comes a sheet of paper with
a 1 cm. gray band and nothing else.

Does anyone know if QMS/Imagen are still supporing the Atari version?

>Or... if you have deep pockets, get CompoScript. I heard it's better.

I don't want to spend some more money and run the same risk again; I'd rather
go out and buy a real postscript printer.

Try ViewGif. As long as the GIF is no bigger than the ST's
screen. Otherwise you have to select an area of the GIF the
size of the screen.

It's a bug fix for the RTS/CTS flow control in the computer.
In the effected versions of TOS, it doesn't work, so you
need this program. What it's for is so that one computer can tell
the other one to stop & start sending data...

BTW: Isn't Poolfix for something else??????

the one for the serial port for high speed modems is SERIALFX.PRG

The Alesis ADAT has 8 DAC and 8 ADC channels, so you can record and play back
all 8 tracks simultaneously, but independently. You can also lock a number
of machines together for up to 64-track recording, at an unchallenged price.
Whether this is possible with multiple falcons I don't know, and I dare say
I won't know until Atari get their act together and sell me one :-)

7160. Re: Help me with Carrier Command!

Newsgroup: comp.sys.atari.st
Date: 1992-12-23 13:12:56 UTC
From: cwa@oasis.icl.co.uk
Message-ID: <1596@ozz.oasis.icl.co.uk>
Source record: 213106

I found the best way was to hit the large cone where all the planes come from, use Manta's to take out any airborne planes, then use a Walrus with a virus bomb to go to the command centre and virus it.

The island becomes yours, and you can maybe save some of the old defences rather than having to rebuild from scratch.

One problem I had though was once I found the enemy carrier and saved immediately. When I tried several times to attack it, I did about one pass then when I turned round to hit him again he had gone. Puzzled, I reloaded, did the same pass, then switched to reverse view, and after a couple of seconds the enemy carrier just VANISHED! didn't move, just bliped out, and I certainly didn't kill him. (I had only fired about 4 ASSASINs at it)

7161. MultiTos redraw problem

Newsgroup: comp.sys.atari.st
Date: 1992-12-23 14:04:08 UTC
From: castermn@nlsce1.seri.philips.nl
Message-ID: <1992Dec23.140408.15936@phcomgw.seri.philips.nl>
Source record: 213107

I want to force a redraw on the INFO-line in a
window. To do that I calculate the x,y,w,h of
that part and than do an form_dial(FMD_FINISH,...)
call. The code looks like this:

```
void redraw_info(void)
{
/* fill dimensions of INFO line in window */
...
form_dial(FMD_FINISH,...);
}

void redraw(GRECT *area_ptr)
{
redraw_info();

/* walk rectangle list below here */
.....
}
```

Upon a WM_REDRAW request redraw() is called.

This works fine under TOS.

I have a MultiTos version. Now this redraw
piece of code seems to come into a infinite loop. For
some reason the AES keeps on sending WM_REDRAW messages
after the first form_dial call.

I trust the MultiTos I have. Now: what is the only and
only good way to do what I want to do ??

Thank you in advance,

Luc Castermans

Pegasus Press
3487 Braeburn Circle
Ann Arbor, MI 48108
(313) 973-8825

FOR IMMEDIATE RELEASE:

Announcing CONNECT -- A New Telecomputing Magazine

ANN ARBOR, MI -- For a limited time, Pegasus Press is offering dramatically discounted subscription rates on its new magazine, CONNECT. Covering the major commercial online services, Internet/Usenet and bulletin board system networks, CONNECT focuses on telecommunications from a user's perspective. The first bi-monthly issue of CONNECT will be available in March, 1993.

Issue after issue, CONNECT shows you how to get the most from the commercial online services you're using -- CompuServe, Delphi, America Online, Prodigy, GEnie and BIX. With columnists on staff to cover these services in depth, you'll find CONNECT a valuable resource.

CONNECT also shows you what "free" networks like Internet have to offer. Every issue of CONNECT contains Internet coverage that helps you find your way around the biggest network in the world.

But CONNECT doesn't stop there. BBS callers also receive a wealth of information from each issue. All varieties of computer platforms are covered in the pages of CONNECT, as are the many different types of bulletin board software and services found on these computers. Articles spotlighting BBSes in specific cities or similar categories (such as medical BBSes or handicapped-related systems) appear regularly.

Finally, each issue contains platform-specific columns highlighting programs available online for IBM and Macintosh users. Of course, you'll also find hardware and software reviews in CONNECT. From high speed modems and LAN-based BBS systems to shareware terminal programs, we cover it all.

Until February 28th, 1993, a year's subscription to CONNECT will be only $12. On March 1st, 1993, the normal subscription price of $18 per year goes into effect. This offer is available only to US addresses.

For more information, please contact Pegasus Press at 3487 Braeburn Circle, Ann Arbor, MI 48108 or phone (313) 973-8825. For the fastest response and a copy of the subscription form, please email us at

pegasus@grex.ann-arbor.mi.us

Don't delay. Get CONNECTed today!

>
> Upon a WM_REDRAW request redraw() is called.

Let's see what happens when a WM_REDRAW request is sent to the application:

the first thing it does is to call redraw_info. redraw_info does some
stuff, and then calls form_dial *to force a redraw*, i.e. to send another
WM_REDRAW message to the application. When that WM_REDRAW is received,
redraw_info gets called, which calls form_dial, which sends a WM_REDRAW
message, etc.

I would expect this code to produce an infinite sequence of WM_REDRAW
messages.

>This works fine under TOS.

Then it just happens that the timing of the redraw messages is such that
TOS is able to merge some of them. That's only by luck, and I certainly
wouldn't count on it working with all versions of TOS (even non-multitasking
ones).

>I trust the MultiTos I have.

Then you're overly trusting. MultiTOS DOES NOT YET EXIST as a finished
product. EVERY version of MultiTOS now in the world is a beta test
```

version. Also, if you got your version of MultiTOS from somewhere other than Atari (and I presume this is the case, or you would have sent the bug report to Atari rather than to Usenet) then you probably have an outdated version; plus, of course, it's a pirated copy, with all of the possible attendant problems. In other words: if you didn't get it from Atari, don't trust it, and don't use it.

I'm speaking here as a "private citizen". If I were speaking officially for Atari, I might very well have other (possibly stronger) things to say.

|>The point that seems to be universally missed here is that if
|>someone decides that they want to use a computer *NOW*, instead
|>of waiting for the ever present Atari "RSN", they CAN do it..
|>
Around 7 years ago I bought my 'real' computer (1040ST) and have been happily 'using' it ever since. I have since upgraded to a Mega and have added-on to the best my budget could handle and the ST continues to be a perfectly acceptable solution to my computing needs. It's a good thing that PC prices have fallen to the point they have, as they need all that 'power', ram, and disk space to get anything done.

You can also add me to the list of people who are getting real tired of your negative, bitter, and personal attacks on Atari and others who post here. Granted that Atari has it's problems and has made more than it's share of mistakes, others have made plenty of mistakes too. There is no perfect computer just as there is no perfect software, etc.,etc. The fact is, many of us reading this newsgroup do so because we like and support the Atari platform and we do not enjoy the continual badgering from you. Dave Bagget has a legitimate beef with Atari and I appreciate his view on that situation, but I am tired of you riding his coat-tails on his dealings with Atari. Why don't you go deal with them and then come tell us about it.

In the meantime can we please stick to worthwhile information that will help those of us who have decided to make the most out of our STs (and eventually our Falcons).

Randy

About the Falcon truecolor mode, don't forget that the trucolor mode reduces bus-performace compared to normal ST-resolution. The DMA has to move more data every fram to get the job done.

>Does anyone know of a program to convert GIF files to ST formats
>(Neo or Degas preferably) - I know that information will be lost,
>but I want to be able to load stuff up quickly, and as long as
>the picture looks vaguely OK it doesn't matter.

Fast-GIF is, (as it says), very fast, and does a pretty good job of
converting any GIF picture into 320*200*16! (And saving it in
Degas PI1 format if you want.) It doesn't handle JPEG, or this 89a
format. (The new one), but it works fine with 90% of GIF's!
(1meg at least recommended, as with all GIF programs, those things can
use a lot of RAM!)

Fast-GIF is on atari.archive.umich.edu in the graphics section somewhere
(or was).... it should be available locally as well. (just about anywhere)

>(we're talking major companies, consultancies, etc here)
>
>Whether atari found the same thing, or the tramiels just love this keyboard
>(ick 8) ... I dunno.

I think the problem is that no one really has any specific applications for
the pad computers, so there's no way to market it. Momenta's marketing seemed
to be, "Here's one of the first pad computers. Buy it." It's not like a Mac
which you buy for DTP, or an Amiga which you buy for video, or an ST you buy
for MIDI, or a PC which you buy for everything else. The pads needed a specific
application and there really wasn't one. On top of that, the technology really
wasn't there to support it; the machines have to be smaller, lighter, and
the pen recognition, if that's what they want to use for the interface, must
be better. From what I've read, Atari's recognition software was pretty good,
but Atari doesn't seem to be, at this point at least, the company to push a
major change in computing, such as pen/pad computing. It would take a lot
of advertising and marketing, similar to what Apple did with the Mac, and we
all know how Atari likes to advertise. :^) Especially without any kind of
certainty that it would be worthwhile.

Pen computing is/was just a shot in the dark. It'll most likely be back later,
as Arnold would say perhaps, "Ah'll be bahck." :^)

Another quip'

Are the Falcon's modes (3 of them anyway) compatible with TT-low/med/high?

Otherwise, the few programs specifically written for those resolutions
wouldn't work too well on the Falcon.

Also, is the 040 a 32Mhz processor? If so, I'll buy that instead of the
Falcon 030.

Atari 1040STE with 4 meg of memory, no monitor $400
and the following software.

Incluede free with your purchase is :

TV sports football ..... (football simulation,great graphics)
Sundog ..... (Space role playing)

Timeworks Word Writer ST ... (Word Processor)
Data Manager ST ... (Database program)

Degas ..... (paint program)

15 or 20 Disks full of PD software.

a year or so worth of old issues of START magazine

This isn't quite right.

The difference between "send" and "sendb" is that "sendb" always uuencodes
the files you request. "send" checks to see if the file is asciii or
binary first then uuencodes if appropriate. Unless you really need
uuencoded text files, "send" is the proper command to use.

>I won't know until Atari get their act together and sell me one :-)

Good question. The DSP DMA is full duplex, it can record and playback
simultaneously at up to 1MB/sec in each direction. (I.e., 8 channels, 16 bits,
50 khz.) Since you can provide an external clock, and there are a variety of
general purpose I/O bits on the DSP port, I'd say it's pretty easy to slave
a couple Falcons together. However, it's certainly not something that's
explicitly provided for.

>the Supra drive so that I can boot with the ICD/Quantum drive and then
>later turn on the Supra 20Mg drive to backup some data?

The SCSI ID number is usually set by manually moving a jumper on the
hard drive's controller board. If the drive is an embedded-controller type,
then you probably can't change the LUN at all, it's hardwired as zero. You
need to open up the case, see what kind of physical drive is present, and
then find the manufacturer's data sheet for that drive to get the required
configuration info. (Just saying "Supra" doesn't tell anything; Supra and ICD
and all the other companies that sell pre-packaged hard drives just buy bare
drives from any number of sources, tack on their host adapter, and then mount
it inside a case. Your "Supra 20 MB" drive could be a Seagate, Miniscribe,
Micropolis, or one of a few dozen other mechs. If it's not an embedded
controller type, then it probably has an Adaptec SCSI controller, but that
could be for MFM or RLL drives, etc. etc....)

>Is this all that it does?

Pretty much. However, "bitmap" is somewhat over-specific. I believe the Falcon blitter is also used to perform block memory transfers to the IDE hard drive, just as an example.
>
>Which chip is responsible for the STe's hardware scrolling?

The video shifter chip. All of the STe shifter's capabilities are also present in the Falcon's video chip.
>
>Most other game systems use a very fast graphics chip to take care of
>the sprites, scaling, scrolling, etc.

The blitter does fine for sprite manipulation. I think it also serves for scaling (but not certain there). Scrolling is already handled by the video chip.
>
>My question is: If ATARI is interested in making this system a competitor
>in the computer entertainment market, why didn't Atari include one?

The Falcon is a home computer that also can play games, not a game system that happens to contain a computer. Different emphasis, I'd say.
>

>did not matter too much at all.

Well, a 6502 (er, 65816) is a pretty efficient chip, as microprocessors go. Almost all its instructions execute in a single clock cycle. In contrast, the fastest 68000 instructions all take 4 clock cycles, and the average cycle time is out around 6 cycles. Given this disparity, it's plain to see that clock speed alone isn't enough to judge anything, and anyone who looks solely at speeds to judge systems is an outright fool.

>The Sega Genesis is based on a 68000 CPU at the speed of 7.6 MHz.

>If the Falcon030 does NOT have a graphics chip that is responsible for
>these features, won't the video game systems pass this system by?

Neither the PCs nor the Macs have any hardware-assisted graphics to speak of.
I.e., no blitter, no sprite generator, no fine scrolling either vertically or
horizontally, very limited video memory constraints. Games are written for
these systems all the time. It seems to me that you're being a bit over
concerned about one minor detail (especially when there are so many other
major details to be concerned about, like, when will the Falcons actually
be for sale in the US?)

As a final note, there are already a huge number of arcade shoot-em-up
games on the plain ol' ST, which doesn't even have a blitter. Most of them
look pretty good. What's the problem?
>
>I doubt there is any way that a FUTURE 64-bit RISC graphics chip can be
>added to the Falcon030 at another time...

True enough. The Falcon's memory is only 32 bits wide, after all; what good
would a 64 bit chip be inside there anyway?

the patch I use is called serfix11. it fixes the CTS/RTS handshaking bugs
found in most tos's. if you don't use it, a couple of things can happen.
as mentioned above, the data from the ST can out run the modem speed or the
handshaking lines will get stuck in the "wrong" state. feel free to send
me email if you want more information.

I realize that scrolling is, but how can we find out if scaling, rotation,
and other things have been added to the video chip?

Maybe I'm concerned about something that the Falcon might already have.

Hmm, but HOME computers are regulary used to play games.
And it would definitely be a bonus if it could really play some kick-butt
games...

Dad does work at home (types up letters, does his income tax, accounting, etc.),
Mom keeps a phone list and does other things similar to dad.

And what do kids do? Which usually out number the parents?

They MIGHT type up their papers, but I bet that they play games more
than anything.

And is there any chance that Dad or Mom will play any games? Certainly.

Entertainment should be a major issue for HOME computers.

>be for sale in the US?)

First of all, the only reason games are written for the PC is because
there are millions and millions of the out there.

Atari won't have that advantage.

Another thing, Mac games aren't exactly fantastic...

But the Amiga500 (though people will disagree with me) actually put
Commodore on the map due to everyone buying it for games.

I know three people that bought it mainly for the purpose of
entertainment even though they also use it for word processing, etc.

I'd say that a home computer's abilities where games are concerned
is very important.

Though, I can't agree with you more about the shipments of the Falcon030...

WHEN???

>

By the way, you said what good would a 64-bit RISC graphics coprocessor
do anyways?

I'm not sure. I don't think I could imagine what that thing could
possibly do for the purpose of entertainment, video production, CAD, etc.

But I bet if Atari ever managed to connect a Virtual Reality helmet
to a system with it, there would be some great times.

>Commander without serious slowdown).

Good question, and one I hope someone can answer more fully than I
can. However, there does appear to be several emulators in the works
already. Whether anyone bothers to import them to North America is
anybody's guess. The biggest bottleneck is, as you say, the 16 bit
interface to memory. Does anyone know if the *86 chips can do the
dynamic bus sizing that the 68k chip can. It would seem to me that, if
they can, then the rest of the Falcon could just emulate the various pc
i/o areas, and fairly quickly as well. If the graphic section of the
Falcon could emulate a VGA card, then it should be fairly fast, but from
what I've been reading on rec.games.programming, there are video modes
in VGA that are programmed directly in some games. This might break an
emulator, unless some how the 689030 mmu could still be utilised to
direct the memory accesses to handlers to deal with this.

The way I see it, Atari's going to have to launch two major Falcon030
advertising campaigns this year and increase distribution beyond
your local (hahahah) independent Atari Dealerships.

One will have to be around March/April. The advertising campaign
will have to promote it as a multi-media computer and in music magazines,
a music computer.

But, dealers like Walden Software will have to be signed.

And I think another one around September/October...

We'll see. You are right, it all depends on Atari advertising it and
how well they do at advertising it.

>
> One thing I'm very pessimistic about is whether Atari will be able to

You know, I was thinking about getting a major letter writing campaign
together and try to get software companies to support the Falcon030.

But, if a representative like Sierra visits Atari and is treated in
much the same way as Dave Baggett, my efforts will be wasted.

I have to get some confidence in Atari before I start mailing letters out.

>Are the Falcon's modes (3 of them anyway) compatible with TT-low/med/high?

Lessee, TT-high is that 1280x960 monochrome, right? The Falcon's highest standard resolution is 768x480; 880x600 with ScreenBlaster (which I have only heard of, not actually seen). I guess that rules that one out (although "compatible" can be interpreted different ways - are the pixels laid out the same way in memory? Yes. There just aren't as many pixels...). I don't know what the other TT resolutions are, offhand.
>
>Otherwise, the few programs specifically written for those resolutions
>wouldn't work too well on the Falcon.

Heh. There shouldn't be any programs written *specifically* for those resolutions, though.
>
>Also, is the 040 a 32Mhz processor? If so, I'll buy that instead of the
>Falcon 030.

Like most processors, the Motorola 68040 comes in a range of speeds, with 25 MHz probably being the slowest available. I don't know what the top end is, that's a moving target that increases from year to year... No idea what the Falcon 040 might use, although since Atari has shown a preference for powers of 2, I guess an even 32 MHz seems likely.

(Say, where do these other guys get their funky clock speeds from, anyway? 7.15, 7.75, 14.5, etc......)

Source record: 213145

Another nifty thing about TRUE COLOR Mode is that when writing complex computer generated screens in real time, like the 3D projections of a flight sim., you do not have to go through all the palette registers to find the closest RGB match to the color you want to display. This looking up can take a lot of time, specially when the comp. gen.'d screen has many colors, i.e. gouraud shaded polygons (now some people qill say "Wait a minute! You can't generate g. shaded polygons in real time! can you?" well think again. Simple gouraud shading is not too time consuming. especially with a DSP. Look at the latest flight sims for the PC line for some impressive example of this. And those things have slow buses too!). What this all means is that TRUE COLOR Mode will not only look better but it may also perform faster than 256 color mode when using this kind of graphics!

Sebastian Ferreyra

I can't wait to get my hands on one of these falcons. I am negotiating for a TV channel in Argentina to get Falcons too for DSP and low end video. The cool thing is that I am the one that will get too fool around with all those Falcons once they get them. Imagine, 2-3 Falcons in one room all linked up thrugh the network. (mouth salivating heavily, saliva globs falling on keyboard)

>applications.

Let's put that into perspective, shall we?

The Falcon COULD BE "exciting" if only the Shot-In-The-Foot guys can
actually get it on the market before its "leading edge" claim becomes
old news...

I'm betting even Sam "We're talking about a machine that will be
available next week" Tramiel won't hold his breath until they're
available here in the U.S. (But I'd sure LIKE TO SEE HIM DO IT!)

The Falcon rollout would make a great title to a movie sequel:
Falcon: The Debacle Contiues.

>the enemy carrier just VANISHED! didn't move, just bliped out, and I certainly
>didn't kill him. (I had only fired about 4 ASSASINs at it)

the enemy carrier goes _as_fast_ as a manta. I've never seen the enemy carrier
vanish, but i have seen it take off at mach 1.
Thats kinda a problem, cuz like...a carrier would wiegh a couple of kilotons
and there is all that water in the way.

if you have a laser on your manta, the fleeing carrier is a sitting duck.
just fly really low behind it, blasting away., after 20-30 seconds, he's gone.

(kinda a cheat really)

7194. Photochrome problem (was Re: GIF/RAW/RCS/SPC ETC.

Newsgroup: comp.sys.atari.st
Date: 1992-12-24 07:09:49 UTC
From: dave@admiral.uucp
Message-ID: <1992Dec24.070949.27227@admiral.uucp>
Source record: 213054

I snagged a copy of Pchrome 3.0 from a.a, and tried it out on my old 1040 ST (no e). Worked just fine, great in fact, even better than my old viewer, DigiSpec (and to think, I paid $50 for DigiSpec).

But I wanted to see the 32k color mode. So, I trekked down to my "local" dealer (about 30-40 miles away) since he has an STe, plus he carries 'Migas, so I figured, great chance for a head to head comparison...

Unfortunately, all I had in terms of pictures were old 256 color GIFs. Well, no problem, there was a 24 bit IFF on the 3000 they had set up. So, I got the salesguy to transfer it to a DOS-format disk, and I loaded it up. No go. It would display just a bunch o' garbage on the screen. So, I figure "Ok, it can only handle MOST IFF's, I guess not 24-bit ones...".

So, we go back to the 3000, and convert the pic, via ADPro, into Targa format. This, I KNOW Pchrome can display. So, back to the STe,and load up. Still no dice. More garbage on the screen. Well, by now, the store was closing, so I had to leave.

What's the deal? I can accept that it didn't do it in IFF format, the docs say it doesn't handle every one, but it's supposed to do Targa files, isn't it? I mean, the option is there on the screen!

The machine I tried this on was a Mega4STe, in 8 Mhz mode. I tried it in 16 Mhz-buffered mode, but it wouldn't even display GIFs at that speed, not surprisingly.

The point that michael.smith seems to be trying to avoid is that PC based computers CAN be upgraded, no matter what the "little" hassles may be, while ANY Atari computer CANNOT be upgraded without doing a lot of "hacking and slashing"...

If you need to take an hour to install a '386 board into a '286 computer, then maybe the girls in the Terminals department could help.. they do it all the time. Upgrading computers is one of the EASY things to do, IF the computer is designed for it..

So what's your point..?

Are you trying to say that "all PCs suck and we all know it" and Atari rulez..?

Sure there are compatibility problems in a platform that allows expansion.. but are you trying to say that the ST platform doesn't have compatibility problems BECAUSE IT IS NOT EXPANDABLE..?

Sounds pretty silly, Michael...

So inevitably the flame wars follow..

FTP the "YO Demo" from either wuarchive or lowell to see an "ST" like
demo on a PC..

Better yet, get the "UnReal" demo...

I haven't yet been able to get that one, since my ST doesn't support
high-density disks.. and the demo is over 1 meg..

(If you've been following the Atari follies, you'll know that I use my
ST for *all* my telecommunications...)

Both lowell and the mirror at wuarchive has an extensive demo subdirectory
with these formerly "ST and Amiga" only type of "demos"..

Anyone who wants the full path, or IP addresses for these PC archives
can E-Mail me, but be warned that it's like becoming familiar with the
"devil"... you may actually find out that those "sucky" PCs can do
the things you always thought were the exclusive domain of your 1985
ST...

|> >chip.
|>
|> I realize that scrolling is, but how can we find out if scaling, rotation,
|> and other things have been added to the video chip?

The STe blitter could do bitmap scaling (using halftone RAM with the smudge bit set) so if the Falcon blitter is upwards compatible it should have this. I don't know of any commercial programs that used it on the STe though... Anyway sprites can be scaled very efficiently with just the 68k. Rotation is a bummer though; you really want enough RAM so that you can store pre-rotated (and antialiased for non 90deg rotations!) sprites.

I can't see any point in having scaling/rotation hardware in the video shifter unless you want whole screen video effects.

BTW What I'd really like to know about the Falcon is how the various buses/DMA devices work - this will probably be the limiting factor on state of the art games/graphics; eg

Is the sound/DSP DMA done using hblank video cycles (ala STe/Amiga) to avoid bus contention?

Does the 16bit<->32bit link combine consecutive 16bit accesses into single 32bit accesses to reduce cpu/video bus contention?

Where does the blitter take its bus cycles from?

Are 68030<->main memory transfers done using synchronous or asynchronous bus mode?

What does the sound/DSP DMA look like from the DSP side? polled? can 56k fast (2 cycle) interupts be used?

Since several c.s.a.st readers claim to have Falcons & official docs someone most know... or is this stuff still TopSecret?

I've been reading a couple of times that the 'only' way
to upgrade an Atari is to slash and burn. Well I think
this is not correct. Some five six years ago I started using
my first atari, an 1040 ST. A couple of years later I reached
its bounderies and bought a Mega 2. I could do this because I
could get a nice price for my old 1040 ST. And the fun part was
that all the software worked (99.9% I belief) on the new machine
and I did have to learn a new computer system (hardware and
sofware). If it wasn't for the lack of money I would have used
the same swapping/buying-method to get a Mega STE a year ago.
Having the same advantages as before.

So what I'm trying to say is, that with an Atari there is also
a possibility to upgrade and be compatible. You just do not have
the same machine. Ofcouse there are those who have such an
intimate relation with their atari.....

Hi,

I've just laid my hands on a second hand STe for my children to play with.
When checking it out I discovered some very strange reports. I've run
a number of programs but the first to strike me was qindex16 which
reported the TOS version as 1.2!! I checked further and found tos_vers
thought it was 1.98 with Gem 0.23 and AES 1.64. Running memmap it reported
version 1.ae(diphthong) 1/1/90.

Now my original STe is 1.6 & that reports sensibly. Any ideas what I've
laid my hands on or is it just the routines I'm running are in someway
broken. Whatever it is, it seems to run all my progs OK.

As its the holiday, could you reply to my home mail address john@its.bt.co.uk.
I should be able to read this group from home, but there's just a chance
things could go wrong (forever a pessamist).

Thanks & Season's Greetings.
John

|> not too time consuming.

The good thing about true color is that it is 1word/pixel layout in memory rather than interleaved bit planes. Thus you can set the colour of a pixel with 1 access rather than 16. With flat shading this isn't so important since you can write 16 consectutive pixels with the same colour. With gouraud shading the value of each pixel is calculated individually and it makes a big difference.

256 colour palette with 1byte/pixel would be much faster for shading and texture mapping but unfortunately 256 color modes use interleaved bit planes on the falcon.

It _might_ be possible to do real time gouraud shading and even texture mapping in true color mode if the bus is fast/smart enough.

|> especially with a DSP. Look at the latest flight sims
|> for the PC line for some impressive example of this. And those things have slow
|> buses too!). What this all means is that TRUE COLOR Mode will not only look
|> better but it may also perform faster than 256 color mode when using this kind
|> of graphics!

The DSP<->main memory bus is unlikely to be fast enough for the DSP to do shading. The trick is to have the DSP do all the 3D/lighting calculations/facet sorting/clipping at polygon level so that the 68030 can spend ~90% of its time rendering polygons
- ideally with a tight (<=128 byte) inner loop so that it gets most of its instructions from cache to avoid bus contention.

Suppose 6byte/vertex (16bit x, y, color) and average of 6 vertices/polygon.
At 30fps with say 500 polygons on screen we need ~540K/s DSP->main memory.
Assuming the world is stored in DSP RAM the main memory->DSP transfers will only contain position updates for moving objects. Just about doable...
but only just.

Its the speed of the 68030 and the 68030<->main memory bandwidth that worries me. Even with the best algorithms and coding tricks I doubt you can render even a small gouraud polygon in ~300 instructions... but maybe its possible to find a neat way of preprocessing the polygon on the DSP (eg y-sorting verticies, precomputing Bresenham increments for each edge) to speed things up; or do something clever with the blitter.

Steven

7206. Upgrade Woes

Newsgroup: comp.sys.atari.st

Source record: 213062

Every once in a while, I see netters complain that they have had to move from an ST to an STE or maybe to a TT. Their gripe is they should have been able to upgrade their first computer rather than change computers. Well, I own an ST and a MegaST and I use a TT in my full time day job. My MegaST is from 1987 and I have added more RAM (4 megs) and a REFLEX graphics card (1024 x 496 on an SM124 monitor). Other than that, my MegaST is stock 1985.

Now, picture the PC user who owned an XT in 1985 and then upgraded to an AT to go with the market. Then picture the poor bugger getting a 386SX because the SX's were so much cheaper (at one time) than a true 386. Now, imagine if you will, the same poor bugger wondering whether he should go to a 40MHz 386 with a co-processor or to a 486 because Windows runs too slowly on his SX. Imagine, again, scouting the market for a faster graphics card that actually lets his screen redraws take place at a reasonable speed.

I am DAMN glad I did not buy into the PC market - I like my money in my account and not spent on hardware upgrades (I won't even begin to detail the cost of software upgrades on a PC).

My only problem right now is slow redraws with Pagestream. I could get a T25 board but I think I'll wait for a Falcon. I don't mind the move from an ST to a MegaST to a Falcon since it is not analogous to the PC scenario. First, the cost of the upgrade will be lower overall (and spans 7 years altogether - got my first ST in June 1985). Second, MOST of my software should be usable as is (unlike the upgrade from DOS based to Windows based applications).

In closing, I wish everyone (yes, PC, Mac, Amiga, AS Atari, ... etc) a very Merry Christmas and a great new year!

7207. The 64-bit CPU by Atari

Source record: 213065

On Tuesday evening Bob Brodie showed up to the Delphi conference. The
following questions and answers are paraphrased a bit, but are as close as
I remember them.
Q: Can you squash the rumor that Atari has designed a 64-bit CPU?
A: No, I can confirm that rumor as true.
Q: Will it be used in a future computer? (non-game console)
A: Its only logical a CPU be used in a computer.
Q: Is it RISC or CISC based?
A: That would be risky to say. (notice the pun :)

For me this was the first confirmation from Atari I have heard on this
64-bit chip as fact. The question still remains to me if this is really a CPU
or a GPU, and that I guess will remain to be seen, as has already been discusse
d a general CPU would be next to unbelievable.

If you already have the True Color value of the pixel, converting to 256 colors
will require at least 3 divisions (make them shifts if you want and can) and
two ORs when using the 6R 7G 6B color distribution. I think this is one of
the best distributions when using polygon graphics with lots of colors since it
looks to me (I'm not sure about this part) that it's one of the fastest.
But suppose that you found a faster algorythm, and suppose it only
requires one or two extra instructions besides the move to memory. It still is
slower since you can directly move the True Color word to memory. And remember
it takes the same time to move a word and a byte.

Once more I say it takes the same time to write a byte or a word in a bus
bigger than 16 bits so if the bus is not fast enough to do it in True Color
then it can't do it in 256 color mode either. I didn't know the Falcon used
interleaved bits for 256 color. This is rather sad since it may take more time
to draw the screen in some cases(like using 8x8 sprites).

>|> [More stuff I wrote deleted]

That's what I meant when I said "specially with the DSP". The DSP can be used
for vector transformations and ligting calcs. while the 68030 draws the
polygons.

>Its the speed of the 68030 and the 68030<->main memory bandwidth that worries me.

I think the 68030<-> is fast enough. I imagine it's a lot faster than an ISA
bus on the PC. The latest flight sims on the PC use gouraud shading on some
objects like polygons and stuff. I'm sure that the update is not even 30 frames
per second on those games but it is fast enough to be acceptable.

>Even with the best algorithms and coding tricks I doubt you can render even a
>small gouraud polygon in ~300 instructions... but maybe its possible to find

>something clever with the blitter.
>
>Steven

I was thinking somewhat along the same lines you are. The world should be
stored in DSP memory. The DSP should be constantly transforming polygons and
calculating the lighting for them. It can get two requests from a 68030, either
change camera coordinates in which case it clears the buffer and starts
recalculating, or get the next polygon to be rendered (already sorted).
When it returns a polygon it returns the the vertices (4 bytes each, 2 for x &
2 for y) and the plane equation coefficients for calculating the color at each
point in the polygon. The 68030 would then calculate the polygon and the colors
using the standard techniques coded for maximum perf. of course.

IMWO: (weary)

Sorry, but people only publically make this kind of acknowledgement that Atari has *serious* problems after a huge Atari Cheerleaders v. Anti-Cheerleaders flamewar reminds everyone how bad it really is to own an Atari computer (and therefore rely on Atari for anything) these days. It's like some of us get really tired of the lies, ludicrous rumors, and dreams that urge people to sink more money into a dying compnay's products, and we feel compelled to post some arguments, therbey eliciting a massive backlash of ill-will.

If you are SO sure about your decision to buy a Falcon, then hearing criticisms of it (or Atari) shouldn't sway you one way or the other. If you aren't so sure, then it's probably good to hear even a devil's advocate giving his side of the story. (I don't know about you, but I still consider a US$1000 computer a major purchase, and hence one I would not want to make without adequate research and soul-searching.)

Bob is about the only person who's willing to contest some of the *absurd* Pollyanna visions some people who post here have, as well as the rampant disinformation we are drowning in in this group. (A case in point being the "demos" thread wherein Bob had to explicitly provide pathnames to software that's been around for quite a while, and that anyone who'd read even a week's worth of comp.sys.ibm.pc.games would know about.) Bob may be *wrong* on some points, but at least he's broadly informed, and isn't just arguing from the point of view of someone who's had his head in the Atari sand for 7 years. We should really compile a FAQ, "Incorrect Crap Atari and Amiga People Think is True about PC's and Mac's" so that we don't have to keep explaining that YES you CAN get 386/33 motherboards for $185, or that GEE, Mac's have had software-transparent 24-bit color support for two years, or UH-HUH, PC's DO run good Unix implementations these days.

People like BobR keep Atari honest, and they keep Atarians from getting more deluded than they already are.

Sometimes Bob may cross the line between "cynical" and "belligerent," but that is not, I think, what you are faulting him for when you say he "wallows in a pit." Few people are willing to take as much abuse as Bob just to defend their viewpoints. Being (as someone pointed out

here recently) a "Type A personality," I respect that. :) It seems like the usual way readers of this group deal with Bob is to gang up on him to such an extent that he can't keep up with all the posts he has to respond to, and then gives up. It's easy to post a "me too, Bob sucks" message, but what does that contribute? Like saturation bombing, this is effective but not very inspiring strategy. If he's such an idiot, you should have no trouble dispatching him quickly with well-reasoned arguments. Right? Right?

If you disagree with what Bob says, respond to him pointedly, but lose the personal attacks. If you use them then he will find it hard to resist retaliating with a bit of the same. It usually looks to me like people who get criticized for personal attacks have been drawn into that sort of thing by a constant barrage of ad hominem from their "opposition." In theory we are trying to get at the heart of Atari's problems in these threads; that's the first step to fixing the problems, and that's why it's a useful endeavor and appropriate to this group. If a vocal minority thinks that Atari computers are hampered by their closed architectures, for example, that's indicative of a similar opinion in the world at large, and hence suggests that it's crucial for Atari to understand and address that issue before cranking out yet another home computer.

These discussions (ones that Bob typically plays a key role in) are a gold mine of information for Atari. If only they read this stuff and took into heartfelt consideration, they wouldn't be where they are today. (Do you think Sam knows that 386/33 motherboards are $185? I bet you he doesn't. Do you think Sam cares two hoots in hell about open vs. closed architectures? I bet you he hasn't really thought about it. Do you think Sam has ever heard of the TI34010? I have a funny feeling he hasn't.)

7213. Re: Falcon BUS..

Newsgroup: comp.sys.atari.st
Date: 1992-12-24 23:49:10 UTC
From: hyc@hanauma.jpl.nasa.gov
Message-ID: <1992Dec24.234910.28952@elroy.jpl.nasa.gov>
Source record: 213074
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st,comp.sys.amiga.advocacy

Well, I finally got around to compiling this with GNU C. Here are some
numbers for the Falcon in a couple different graphics modes:

Test 640x480x2 640x480x256 320x240x16

16 bit read 6206061 3413333 5610959
16 bit write 16384000 6400000 14124138
32 bit read 6301538 3442017 5688889
32 bit write 31507692 7876923 24094118

Here's a comparison from my Mega with Turbo16:

640x200x4

16 bit read 7876923
16 bit write 2884587
32 bit read 7876923
32 bit write 2884587

First, looking at the Mega-ST, the numbers clearly agree with the fact that
the ST has only a 16 bit bus. The read numbers appear exaggerated to me,
probably due to how the Turbo-16 cache works.

The numbers for the Falcon are a little less clear, but I'd figure that the
read speeds for 16 and 32 bit cases indicate a 16 bit bus, with the slightly
higher speed in the 32 bit case due to having to execute one fewer instruction
in the actual test loop. (Well, it's still the same instruction count, but does
a NOP really consume as much time as a post-increment?) The write speeds again
show the effect of caching, which makes this test a little suspect. As you
can see in the 640x480x2 case, the video doesn't slow down the processor at
all in the 16 bit write case, the write speed is the maximum achievable on
a 16 MHz processor with a 2 cycle write. Or rather, the 68030 cache is able
to make up for any delay that might be present. But for the 32 bit case,
the impact of the video becomes noticeable, being about 4% slower than the
theoretical maximum.

This test program only used a 2K data set, so the cache effects are too
significant in these results. I guess I should try it again with a 64K
data set, to override the Turbo-16's 32K cache and the 68030's on-chip
caches...

In the meantime, I'd be curious to see the results of this program run on
an Amiga, since we've been bandying around so much stuff about all this ...

> The DSP is a sound processor, making the Falcon very attractive to
> musicians.

Wrong. Please don't state things like this that you obviously have
no clue about. The DSP56001 IS NOT A SOUND CHIP!!!!!

This is from the Motorola Technical Data book on the DSP56001 (you
should read this before you talk about the chip. Maybe this should
be in a FAQ list? Is there a FAQ list?)

```
-------------------
DSP56001 24-Bit General Purpose Digital Signal Processor

The DSP56001 is a member of Motorola's family of HCMOS, low-power,
general purpose Digital Signal Processors. The DSP56001 features 512
words of full speed, on-chip program RAM (PRAM) memory, two 256-word
data RAMs, two preprogrammed data ROMs, and special on-chip bootstrap
hardware to permit convenient loading of user programs into the program
RAM. It is an off-the-shelf part since the program memory is user
programmable. The core of the processor consists of three execution
units operating in parallel - the data ALU, the address generation
unit, and the program controller. The DSP56001 has MCU-style on-chip
peripherals, program and data memory, as well as a memory expansion
port. The MPU-style programming model and instruction set make writing
efficient, compact code, straightforward.

The high throughput of the DSP56001 makes it well-suited for
communication, high-speed control, numeric processing, computer
and audio applications.
-------------------

The databook is huge, 70-80 pages, so I'm not going to type much
more, but the following is interesting:

-------------------
Speed: At 13.5 million instructions per second (MIPS) with a
27 MHz clock, the DSP56001 can execute a 1024 point
complex Fast Fourier Transform in 2.45 milliseconds.
Precision: The data paths are 24 bits wide thereby providing 144 dB
of dynamic range; intermediate results held in the
56-bit accumulators can range over 336 dB.
Parallelism: The data ALU, address arithmetic units, and program
controller operate in parallel so that an instruction
prefetch, a 24x24-bit multiplication, a 56-bit addition,
two data moves, and two address pointer updates using
```

one of three types of arithmetic (linear, modulo, or
reverse carry) can be executed in a single instruction
cycle.

w>Some "Applications" programs do however.

From my not-so-limited experience, what PC games use is in most cases
320x240 at 256 colors or 640x480 at 16 colors, since this is the documented
maximum in the VGA specs. For anything above that, PC games' authors would have
to include card-specific drivers. Usually, they don't.

Bob_BobR_Retelle@cup.portal.com writes:

>[thoughtful but somewhat wordy stuff deleted] 8)
>So, what is it that makes a computer "exciting"...?

Should one's choice of computer(s) be an emotional issue? I am forced to agree with you that it is. "New" is what makes a computer "exciting". New peripherals, new programs, new experiences of sight and sound. Newfound functionality. This is what drives the ever upward spiral of processor speeds and graphics resolutions. How many people really need 66mhz? For what? How many things do you need to do that couldn't adequately be done on an 8 bit machine? I'm sure there are some but not many. Perhaps Atari's salvation will be that they will market cans of "new computer smell" to stimulate the users olfactory senses until Falcons arrive to tempt us with new sights and sounds.

Please accept my opinions on this matter in the light they were given even if the original question was thought provoking.

Hi folks!

My problems in compiling a tcsh with -mbaserel and shared text were related
to a bug in the MiNTlibs that is fixed now in PL 25. So I can announce that
tcsh 6.00.02 is ready for download on

ftp.uni-stuttgart.de (129.69.1.12)

ST version: /soft/atari/MiNT/shells/btcsh.zoo
TT version: /soft/atari/TT/MiNT/shells/btcsh-TTbin.zoo

The TT version was compiled with -m68020 -m68881 and the appropriate libs.
If you have problems with tcsh's memory allocation, please experiment with
its stacksize, I think I set it to a value of 250 KB.

Happy New Year!
Markus.

I just got the file hdchck13.lzh from /DiskUtils at a.a

it crashes if you try to list/test/extract it with lzh201l.ttp ,
but if you test it with unlzh172.prg , it goes fine!
The archive does have comments in it, does this crash lzh201l ????

Dunno about easy to use.

> 2) Supports batch files
> 3) Supports environment variables
> 4) Has an efficient command set

Everyone seems to like this UNiX thing. (Pointless really, buy a
WIMPS machine, then immediately stuff UNix onto it, and use it as default
but....)

So, since you obviously don't want to use the Atari as such, why not buy
a UNix Machine?? (GEM programs don't usually work too well from CLI,
unless GEM is booted first, and then they have been known to complain,
although, not much 8-)

Why does everyone out there seem to use UNiX on their ST, instead of getting
a REAL UNiX machine, which would drop compatibility problems (if any)
to pretty much NOTHING, and you wouldn't have to chance seeing the GEM
environment again. Any GOOD reasons?? (Of course, you wouldn't be
able to run any ST-Programs on a UNiX machine, but if you run UNiX anyway,
you should be reasonably used to that.)

That's right. I saw the desktop in true color mode, and the drawing of windows and menu is as slow as on a basic STf 8Mhz (I mean without any graphic booster, software or hardware).

In true color mode, you can't do rasters nor dual playfield. (Of course you can, but it would take lots of time, good bye 1vbl games...)
That's why I don't think that the best shoot'em up on the Falcon will be in true color mode : they will be in 256 colors mode.

For other kind of games, I don't know what will be the best modes, but the game developers who have some Falcons at this time will tell us what they do think about it after having tested it.

But for most of games, it will be easy and cheap to port graphics from PC to Falcon and A1200, thanks to 256 colors mode, that's why the companies which will make games will do that, as they did with PC, ST, A500 for 320x200x16 games.
There will be of course some specific games, but just wait and see...

LS>
LS> Then why didn't they use it in the Falcon to begin with?

Price. It would have made the Falcon030 much more expensive, I guess.
Remember, the Falcon030 is a consumer machine for mass market.

LS> Unless it is completely incompatible with it.

I guess it will not be a CPU, but a 'custom chip', a graphics chip
probably. It being a CPU raises a lot of questions concerning compatibility
with the MC680xx series. Or it should be a MC680xx compatible CPU.... nah,
no way! ;-) (if this all is true, of course!)

>> Q: Is it RISC or CISC based?
>> A: That would be risky to say. (notice the pun :)
LS>
LS> I guess it would HAVE to be RISC. But I'm still amazed that Brodie
LS> gave that much information.

Giving such an answer indicates that it is most likely that it will be a
CRISC CPU, in which some instructions are (like in RISC CPU's) mapped
directly into hardware and other ones still have the microcode step. (like
in CISC CPU's)

7237. Re: Photochrome problem (was Re: GIF/RAW/RCS/SPC ETC.

Newsgroup: comp.sys.atari.st
Date: 1992-12-26 13:48:20 UTC
From: d90gth@pyton.csd.uu.se
Message-ID: <D90GTH.92Dec26134820@pyton.csd.uu.se>
Source record: 212934

I snagged a copy of Pchrome 3.0 from a.a, and tried it out on my old 1040 ST (no e). Worked just fine, great in fact, even better than my old viewer, DigiSpec (and to think, I paid $50 for DigiSpec).

But I wanted to see the 32k color mode. So, I trekked down to my "local" dealer (about 30-40 miles away) since he has an STe, plus he carries 'Migas, so I figured, great chance for a head to head comparison...

Unfortunately, all I had in terms of pictures were old 256 color GIFs. Well, no problem, there was a 24 bit IFF on the 3000 they had set up. So, I got the salesguy to transfer it to a DOS-format disk, and I loaded it up. No go. It would display just a bunch o' garbage on the screen. So, I figure "Ok, it can only handle MOST IFF's, I guess not 24-bit ones...".

So, we go back to the 3000, and convert the pic, via ADPro, into Targa format. This, I KNOW Pchrome can display. So, back to the STe,and load up. Still no dice. More garbage on the screen. Well, by now, the store was closing, so I had to leave.

What's the deal? I can accept that it didn't do it in IFF format, the docs say it doesn't handle every one, but it's supposed to do Targa files, isn't it? I mean, the option is there on the screen!

The machine I tried this on was a Mega4STe, in 8 Mhz mode. I tried it in 16 Mhz-buffered mode, but it wouldn't even display GIFs at that speed, not surprisingly.

I know Pchrome seems to have a few minor(?) bugs. One is that it doesn't seem to handle Targa files bigger than 320x200, equal or less than this works fine on my STe though.
(To fix this and the fact that you can't look at a complete Gif bigger than 320x200 without loosing aspect, I wrote a simple rescaling-program for Targas and Gifs of any size into a Targa of any size. Anybody wants it? Email me.)

Source record: 213099

Dave, given Atari's proposed bundling of Conceirge/Sutra, is there any chance that Atari could be approached to bundle GW?

Yeah, I know I'm probably dreaming, but hard feelings aside, it could be profitable and would ensure that the platform had lots of games development (I'm saying this without having seen GW of course).

If GW could be (or is) modularized a base module could be distributed by Atari at their cost, allowing you to sell add on modules.

ATari cold also pay a royalty based on machine sales (.50 per machine alone should add up to $150,000 per year, based on the intent to sell 300,000 falcons per year).

Ohh, and just to add a little more credence to your argument about Atari and bundling of software - I recall receiving ST Basic, Logo and Asteroids with my original ST.

I've managed to get Tex onto my system and thought everything
was fine. The first time I ran it, I received a message about
"stack space exhausted" or something like that. When I quit,
I was returned to the desktop(I am running Tex from Neodesk).

I've tried running Tex a couple of more times and the same
error message keeps popping up and I'm returned to the desktop.

Does anyone know how to fix this or what the problem is?
Unfortunately, I don't read German so the docs don't help.

Thanks for the help.

What many of you seem to forget is that Dave is just ONE developer
that has had a negative experience with Atari.

If you could replay the last five years of GEnie, CompuServe, Usenet,
and online magazines such as STReport, you will see similar
experiences to what Dave has reported.

And you can't just say, "Oh, Ralph just has a negative attitude towards
Atari..." because he didn't write these experiences.

He does seem to magnify the problems so that a lot of people that
don't seem to understand what is going on, will understand.
But the people that do understand, the online magazine looks like
a b*tch fest sometimes.

I talk with developers through e-mail that I've met through Usenet
and they have told me similar stories. I have also talked with Lynx
game programmers that do not believe they will ever program another
Lynx game again. This is because of how Atari handles things.

If Dave was the first to report problems with Atari, I would question
if what he was saying was true or not. But, he is not the first
and unfortunately, probably not the last...

The fact is, things won't change unless people like you start
writing people at Atari that can make changes.

Len

CLIs are very usefull for zoo, gcc, make and all these programs
that need args or environment variables.

Have you ever tried to print a directory with GEM ?
I don't think it's possible, or there is something I didn't
read in the docs.

I enjoy CLIs, but I couldn't bear my ST without GEM, I mean
that I prefer my ST with the GEM alone than with a CLI alone.
But when you've got the both on the screen, it's very difficult
to get back to pure GEM or pure CLI. That's why I say : thank you MultiTos.

You love GEM : if you buy a Falcon, you'll love multitasking GEM much more.
You love your ST : you'll love the Falcon much more.
(The Falcon has nothing less than the ST, only things more).

I was kind of disappointed by that statement as well.

Was it rabies that caused you to right Game Workbench for the Atari platform
in the first place Dave?

Really, Atari has ONE very GOOD advantage over other personal computer
companies such as Apple. This is customer loyalty. And unfortunately,
the company doesn't appreciate this advantage.

If Apple treated their users, developers, dealers, and publications
poorly, they would say "Goodbye", but for some strange reason, the Atari
Community doesn't work this way.

And if I were a part of Atari's management, I would exploit this advantage.

No, really, at the end of Dave's article, he wrote that Bill Rehbock
gave him a Falcon030 because he felt sorry for them.

I'm wondering what happened to this Falcon? Someone else told me that
Dave didn't get it because it was only Rev.2 or something like that and
he was suppose to get a Rev.3 machine.

No, that's not at all how it is.. I just want to use the CLI as a
shell in a BBS system, and PCOMMAND that is there now isn't my idea of
a great CLI. So I _DON'T_ want to use my atari any other way than it
is, it's not even my machine I want the shell for..

7245. ATARI and US!

Newsgroup: comp.sys.atari.st
Date: 1992-12-26 22:30:00 UTC
From: afonseca@terapin.com
Message-ID: <afonseca.2y5x@terapin.com>
Source record: 212911

Hi everyone. I've been an ATARI supporter for a while now, since the 8-bit series. I have been reading the messages here for a while now, and have gotten alot of information from everyone. I think its great that this many ATARI users can get together and discuss these things.

Well I just wanted to say that instead of writing all these messages that seem to say "ATARI SUCKS", or anything close, we should be talking about the positive things that we have as ATARI users. I own an ATARI 1040 STE, and am pretty happy with it. Unfortuantely I haven't been able to upgrade it to the point I want, but I'm still quite happy with it. I plan to buy a Falcon 030 because of the new technology and possiblities it creates. I also plan to become an Atari developer. What I am trying to say is, that instead of bashing ATARI Corp for their mistakes(and I won't say they haven't made any), we should support them as best we can. Those of us who have stuck with ATARI have done so for a very simple reason. We like ATARI computers better than any others, and they do what WE want them to do. Of course, technology changes every day and we all must move on, so its up to us to support our computer company and make sure they move along as well. I think the Falcon 030 will be a good computer, and I think we should support ATARI by buying their computers when they come out, and even trying to communicate to them what we would want from them. I think communication is the best way to save ourselves. And for those of you who have become frustrated with ATARI, and have moved on to other platforms should just stop posting in this group and post in the group of your own computer. I think we need to get rid of all of this negativity towards our computers and our computer company. I read a message by someone who said that ATARI Corp has an advantage over the other platforms, which is its users loyalty. I think we need to keep this loyalty intact, and even increase it if we are to have what we want. Of course we all want something more from our computers, and I'm sure that this newsgroup will help you to find whatever you need in terms of information about what you can do to improve your system. So the bottom line is: GO ATARI!

Thanks,

Alberto

7246. vt100 emulator

Newsgroup: comp.sys.atari.st
Date: 1992-12-27 00:02:27 UTC
From: kgg@mv.mv.com
Message-ID: <1992Dec27.000227.2900@mv.mv.com>
Source record: 212916

Does there exist a VT-100 emulator for the ST?
I have a 1040 ST (F), and there is a service to which I have just
subscribed that doesn't understand about the VT-52, only VT-100 and later.
Product, shareware, free hack, I will appreciate any leads.

For the time being, I cannot subscribe to this newsgroup,
so I'd appreciate any answers via e-mail, at the address below.

Many thanks,
-- Kenn Goutal

Source record: 212920

Please, no flames. I just don't understand.

Why would Atari invite you to a meeting to show off something that they were obviously interested in, only to treat you the way you've described?

Is it at all possible that you've misunderstood them? Maybe they thought they were being funny? You are certain that they meant to insult you? There was malice aforethought? There was malice?

If these are all true, and you would know better than I, I wasn't there, then why did they provide you with a Falcon?

Just make sense of it all for me, please. I haven't read all the posts in the past, so if this has already been hashed out, please just give me the condensed version.

Thanks.

Brook

7248. Jacal1a0 symbolic math program

Newsgroup: comp.sys.atari.st
Date: 1992-12-27 06:32:32 UTC
From: dont@klic.rain.com
Message-ID: <1992Dec27.063232.21086@klic.rain.com>
Source record: 212918

If someone compiles the Scheme interpreter and gets the Jacal1a0 symbolic math program working on an ST I would greatly appreciate a copy.

It would be terrific if it would fit in 512k but if 1024 is needed I can probably handle that too.

It was announced that it was available via ftp from

altdorf.ai.mit.edu:archive/scm/jacal1a0.tar.Z

with the scheme interpreter in

altdorf.ai.mit.edu:archive/scm/scm4a15.tar.Z

and library in

altdorf.ai.mit.edu:archive/scm/slib1c3.tar.Z

Please reply by email if possible

Hello everybody!

After thinking this through (and after a few unsuccessful tries...)...
I've broken down and decided to sell my system at an unbelievably LOoooowww
price.

Last few times I asked for $1500... then went to $1300... then (you get the
picture)...

Here it is in B&W... $800 (w/out printer) + S&H, COD, UPS. $900 (w/printer)
+ S&H, COD, UPS (plus insurance if so desired).

This is a whole system. The printer may be separated.
Everything is close to mint for I value my things with high regard.
The internal HD is backed up! My setup is based on NeoDesk... nice setup
with software accelerators and other enhancements.

MegaSTe4/50MBHD with SC1435 monitor was bought 8/91 after sale of my 1040ST.
I bought those two items alone for $1800.
I bought the printer for $200.
I bought the modem for $200.

Note: software accumulated for over 6 years (when I had my 1040ST). Value
is hard to judge... retail (estimated) > $3500 (???) +++.

OR CALL (702)-331-3093 PST.

Items:

Mega STe: 16 MHz 68000 Motorola processor, (optional) 68881/2 floating point
coprocessor, 4 megabytes of RAM, ST LOW/ST MED/ST HIGH resolutions, 4096 colors,Midi I/O,
WME-compatible Eurocard expansion slot, monitor port, RF modulator
(TV) port, parallel port, serial port, (2) RS232 modem ports, floppy disk port,
LAN interface, ACSI DMA port, ROM cartridge port, mouse/joystick & joystick,
stereo R/L ports, detachable 95-key intelligent keyboard (own microprocessor),
50 MB hard drive (internal), double density floppy, mouse.

ATARI SC1435: 14" diagonal, ST LOW, ST MEDIUM, internal stereo speakers,
headphone port, monochrome (green), swival base.

CITIZEN 200GX: color on command, 3 built in fonts, manual load, form feed, Epson compatible, many options, (included: ~800 pcs. printer paper, ribbons).

SUPRAModem 2400: 2400 baud rate, external compact unit.

SOFTWARE (most on 50 MB hard drive):

NeoDesk 3.02, Flash, Procopy (all versions), Word Writer ST 2.0, Print Master, Typing Tutor, Mark William's C, Art and Film Director, Music Studio, Quick ST, Desk Manager, etc...

Public Domain: tons of .MOD files (amiga stereo sound files) => ~ 12 MB's worth, tons of games, tons of picture viewers, MOD players!!!, tons of pictures (SPC, GIF, PI?, NEO, TNY), tons of utilities, tons of this/that, tons of demos (ST/STE/excellent sound/graphics), tons of everything of hard drive/backed up/and disks.

Commercial: 10th Frame, Airball, Arkanoid, Balance of Power, Elevator Mission, Barbarian (2 versions), Battleships, Beyond the Ice Palace, Captain Blood, Buggy Boy, Carrier Command, Championship Basketball, Championship Wrestling, Chessmaster 2000, Falcon, Flight Simulator II, Hardball, Hollywood Poker, Strip Poker, Ikari Warriors, Jet, Karate Kid II, Leisure Suit Larry in the Land of the Lounge Lizards, Live and Let Die, Lost Duchman Mine, Manhunter: New York,Marble Madness, Match Point, MidiMaze, Temple of Doom, Metrocross, Millipede, Joust, Floid the Droid, Oids, Paperboy, Pinball Wizard, Prohibition, Psion Chess, Road Runner, Star Trek: The Rebel Universe, Space Harrier, Space Station Oblivion, Speedball, ST Vegas, ST Pool, Leather Goddesses of Phobos, StarGlider,Super Cycle, Super Sprint, Temple of Apshai Trilogy, Terrorpods, Test Drive, Tetris, The Guild of Thieves, Tower Toppler, Typhoon Thompson in Search for the Sea Child, Winter Games, Zany Golf.

Well, I agree in all points. I have an old, almost worthless 1040 STfm and a
Megafile 30. And the only reason I have kept this old computer is that I likes
it... It do what I want it to do, and it does that in a satisfying way.
Right now, I am sitting at home with Uniterm and uses a Unix-machine down in
Sundsvall (about 50 km from me) with VT200 and I haven't seen any program which
emulates VT200 like Uniterm, not to the PC or the amiga...

/Jocke

I've bought my Computer, because of the SM124 flickerfree-monochromemode!
The many things I can do with my old MST 4 / TOS 1.2 serve me well, but
since I do a lot of DTP now, I'd love to get a faster Computer, without
changing the Software ;-)

>Please accept my opinions on this matter in the light they were given even
>if the original question was thought provoking.

I hate postings like 'I have the best computer'. People who know, what they
want to do with their computer, should buy the machine, on which they can
do anything they want.

Excuse my bad English HANK

Have you tried the -k option, skip bad headers.?.

Also I don't think LZH201 supported comments at all..??

I don't have problems with LZH201L at all, well there was one file I cound not extract, there was somthing wrong with the header, but then I have been told that the Unix version of LZH201 generates incompatible archives..??

I'd recommend Toki, Klax, Blue Lightning and Gates of Zendocon.

IMHO, steer clear of Electrocop and Guantlet 3.

There are many more cartridges available than most shops tend to carry.
I find mail order (in the UK) is the best way to buy. The carts are a
lot cheaper in the US now I believe. I wish the UK prices would drop
to the same levels. Some games cost as much as #35UKP with cheapest
being #20UKP.

I believe there are some files available for FTP with cart reviews
and other info. I'm not sure where from.

I don't want to start any blasphemous rumours,
But I think that God's got a sick sense of humour - ML Gore

LC>
LC> /* walk rectangle list below here */
LC> .....
LC> }
LC>
LC> Upon a WM_REDRAW request redraw() is called.
LC>
LC>
LC> This works fine under TOS.
LC>
LC> I have a MultiTos version. Now this redraw
LC> piece of code seems to come into a infinite loop. For
LC> some reason the AES keeps on sending WM_REDRAW messages
LC> after the first form_dial call.
LC>
LC> I trust the MultiTos I have. Now: what is the only and
LC> only good way to do what I want to do ??
```

Obviously TOS sends you redraw-messages even when you (think you) only requested a redraw for the infobar. But how do you calculate the coordinates for the infobar? Maybe you're a pixel of and then a WM_REDRAW message get sent and then ouy request a redraw etc. etc.
But WHY would you want to force a redraw of the infobar? It gets redrawn automatically? Or do you change the contents of the string containing the info-line? The only good way to change the info-line is using wind_set(wh, WF_INFO, ...). This will also force a redraw of the info-line. And I suggest NOT doing this in the redraw-handling but when you actually change the info-line.

Hope it helps.

Ta!
Vincent

Some MS-DOS versions of LHarc generate slightly odd LZH files, but just
putting the -k or /k switch in usually seems to over-ride any problems
I've ever had with the thing!

(My command line usually consists of)

/mh a:\dl\[filename.lzh] D:\[newdirectory to create]\

Oops, add a k after the /mh!

This works for 99.9% of LZH archives I've come across! (I've not had
any major problems that a bit of alteration hasn't cured)

From: alrashi@ecf.toronto.edu
Message-ID: <BzxooH.Gp2@ecf.toronto.edu>
Source record: 212925

Hi guys!!
Sorry to bother one and all of you (distrib:world) but I really do have to know: How the $%&$& do I advance in Captive??
From a lot of the posts here, I know that Captive is supposed to be a good game, but I have had quite a bit of troubler in it!!
OOps, sorry about the spelling mistakes - I'm on really cheap computers at themoment (ones with no backspace keys! - incredible huh?) as the good computers are all locked up, this being christmas and all... B^D
Anyway...these are the problems:
1) On Butre - the ABCSSI HQ - I can't seem to get out of the HQ itself. This is the room with the dynamite in it (and the little electricity outlet) The wall at the far end has a little row of small circles running atthe bottom so I knowits gotta be of SOME use...
2) I've come across other places with walls having that row of circles at the bottom so I reeeely need to know the way to get around this!
3) I've been to quite a few planets and moons, but all of these seem to have nothing on them??!? Anybody know any places I should go to?
4) Interesting thing to know: If you land on Suigel (planet) And kill all the dinosaurs, then take off and come back down again... killing all the dinosaurs again gives a lot of XP. Just thought ya might wanna know...
5) There is no number 5...(*smirk*)
WEEeeeel that seems to be it. Oh yeah, pllleeeezzzeee don't send me complete solutions! I justneed a helping hand to get started!! Thanx!!

AcEzE.

From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <72478@cup.portal.com>
Source record: 212927

AL RASHID SHAHIR asked about Captive:

The instruction manual isn't very clear about this, so I don't feel too bad about "giving it away"..

The walls with "circles" at the bottom are "rollerwalls".. the wall is mounted on wheels and can be pushed out of the way.

Face the wall and RIGHT CLICK on the "up arrow" on the screen.

Be careful though.. Captive is a game that lets you accidentally get yourself in spots that you can't get out of. For example, most of these "rollerwalls" need only be pushed one space. If you push them too far, you can block off areas you need to get into later.

BobR

Well, I don't understand either.. but just to show that David Baggett
is NOT an isolated case, here are two messages from prominent Atari
developers which recently appeared in the Atari Productivity Forum
on CompuServe. I'm assuming everyone here knows who GST Software and
CodeHead Technologies are.

And remember please.. *I* am not making this up..

#: 78078 S17/Community Square
23-Dec-92 09:01:42
Sb: #77942-#Falcon: Flies or Dies
Fm: GST Software 71351,332
To: CodeHead Software 76004,2232 (X)

Yup - classic moments at a developers conference - Leonard and I had
arrived at this thing never having met but already having managed to develop
a deep dislike of each other via fax.

Halfway through the meeting he moves onto the topic about which we had
been faxing him and says

"Unlike what some people here think, we are not idiots, I will say that
again, we are not idiots".

before I could respond another developer who had *no* idea about what was
going on behind the scenes of all this happily chips in with "But you've got
to admit you've done some bloody silly things in your time."

Cue Leonard going nuclear.

I always handle such meetings now by reminding myself that a reject dwarf
from Tolkiens Lord of the Rings isn't worth getting that hung up about.

Whereas we have nothing really but praise for Bill Rehbock.

Tony

Tony,

>> a reject dwarf from Tolkiens Lord of the Rings...

Thanks for the first good laugh of the day! :)

Since we're trading stories, here's a good one. One day, we got a call from L_____, who promptly started belittling us (in an extremely condescending and obnoxious manner) for "not following the rules" in MultiDesk. The actual issue in question was rather technical, hinging on whether or not it was permissible to rely on register D1 to retain its value through a Trap #2 call. When we pointed out that Atari's own documentation does _not_ state that D1 is unsafe to rely upon, we got an immediate blustery "Yes it does!" response. (It doesn't.) When we pointed out that TOS itself saves and restores _all_ registers during Trap #2 calls, we got a short silence, and then a hang-up.

About an hour later, we got a call from someone else (not L_____, he'd never admit to a mistake), acknowledging that we were correct. And yet, to this day, FSMGDOS (and probably SpeedoGDOS too) trashes register D1 during its Trap #2 processing.

Unfortunately, this sort of thing isn't unusual at all; it's very routine treatment for Atari developers.

- Charles

7263. Telnet to TU-BERLIN.DE

Newsgroup: comp.sys.atari.st
Date: 1992-12-28 01:14:37 UTC
From: sheppard_r@kosmos.wcc.govt.nz
Message-ID: <1hlkdtINN71v@golem.wcc.govt.nz>
Source record: 212929

Well as we have lost our FTP option on this site, to many
14 year olds getting loads of software each day, it was costing
the council to much, Note: this was a free service, but we could
get it back later next year, but with restrictions..

We still have free E-Mail and Telneting..

So is it possible to Telnet to any Internet site and get software
down..?? like tu-berlin.de...

I have tried to get onto there but it looks like I need a login,
how do I get one..??

Thanks..!

Roger..... sheppard_r@kosmos.wcc.govt.nz

7264. Can we all just get along? (long)

Newsgroup: comp.sys.atari.st
Date: 1992-12-28 03:56:50 UTC
From: chu@acsu.buffalo.edu
Message-ID: <BzyAyq.3vq@acsu.buffalo.edu>
Source record: 212930

I was just wondering, is it possible for anyone to say something positive about Atari without instantly being branded an Atari Cheerleader (with his/her "Pollyannaish visions of Atari")? Also, is it possible for anyone to say something critical of Atari without being branding an Atari Nay-sayer?

The thing that strikes me as I read the threads is that the views all seem to be so polarized and they all eventually degrade into personal attacks. Judging from what I've read, it seems that people seem either desparately ardent in their support of Atari, as if their sheer will could bring Atari into profitability or adamant in their belief of emminent failure.

I think the truth is somewhere in the middle. For some reason which I still haven't figured out, Atari is still in business. The only reason mentioned that might make any sense is that for some other unexplained reason, Atari seems to have this immense customer loyalty. If you think about this, it makes absolutely no sense. Who in his or her right mind would support and be loyal to a company for whom there is little 3rd party support, which doesn't support its customers one bit, and continually fails to deliver on its promises? Yet, there is a small masochistic bunch (myself included, I'm doing this on a 4Meg 1040STe) that does.

This probably isn't the case in general, but for me, the net is the reason why I'm still using an Atari (and why I replaced my ST with an STe when I blew up my ST installing a memory upgrade. I don't think I was properly grounded. Silly me...) If it weren't for the selfless dedication of those who port TeX, gcc and the like (also especially Eric Smith for writing MiNT and freely distributing it) I don't think I would enjoy using my ST as much as I do. It fills the customer support vacuum left by Atari.

Anyways, I'd like to think that those who critise Atari (usually deservedly) do so because they think the computers are pretty decent but the company is running itself to the ground. How close am I?
I'd also like to think that those who proudly proclaim themselves as Atari Supporters feel that perhaps that this is The Big One. The chance for Atari to succeed. (Personally though, it reminds me trying to bring Tinkerbell back to life, "Now if everyone claps really hard..." :-))

My opinion is this:
If Falcon is Atari's attempt to target the mainstream, it will fail miserably. Atari has little name credibility and its possible to get a PC for the same price that will be more useful to the average user.

Yes, I read the a tech spec flame thread. It really doesn't matter that a similarly equipped PC will cost more. That's not the way people shop for computers (at least, I don't know any one that shops like that). They look at existing packages rather than setting up their own. I think software availability will be more important than DSP to the average buyer. Also, no matter what its performance is relative to a PC, it loses in the numbers game. Even if it calculates FFTs faster than a 486DX/66 EISA PC clone (note: I'm not saying it does. I have no idea how fast it would actually work), given most people's penchant for comparing only CPU clock rates to judge computer speed, people are going to think it's a slow machine.

If Falcon is Atari's attempt to target the music industry, then, well, at least there is a chance. I'm not very up on the electronic music industry but I know it was doing well in it at one point so the name Atari might still mean something there (i.e., people don't laugh when you mention it). Plus, Keyboard magazine gave it a favorable overview. Then again, they also have the Apple IIGS a favorable overview when it first came out. Still, this machine does seem to be somewhat tailored towards those sort of applications (although that is not all it is capable of).

Anyways, I think this is possibly Atari's last chance to Get It Right in the computer business. If they play it right, they might actually do fairly well. Given their track record, I have my doubts.
(I would love to see them do well though.)

So, I sit here with the realization that should Atari Corp. fall off the face of the earth, the computers themselves will keep working and the community, which could never depend on Atari Corp. anyways, will go along just as it always has. The Atari community doesn't depend on Atari as much as it does on Howard Chu, Eric Smith (yes, I know he's working for them now), Dave Baggett and everyone else whose names I can't think of right now, to keep it alive. To those guys, I don't think you hear this as much as you should: Thank you very much for keeping this platform interesting and viable.

I've finally gotten the chance to set up emacs and gcc on my STe and if I ever find some time to do some programming that isn't school-related, I hope I can follow in their footsteps. It's not a platform that I would recommend to anyone, but I still feel that it's a platform that deserves to live. Perhaps it's because for the time being, I'm stuck here. (Even if I had the money, I really didn't like my stint developing on PCs and for some reason I find Macs more annoying than user-friendly. Maybe its because I've never had a chance to use one for an extended period of time so that I could get used to it.) However, as long as I'm stuck here I might as well enjoy it and make it as useful as possible.

So, three cheers to those who keep Atari alive!!

Also, a cheer to BobR and the other Nay-Sayers who keep us in line by not letting us get too rosy a picture of Atari.

Finally, a cheer to the Perpetual Optimists who keep BobR in line! :-)

7265. How do I make a PC mouse work on my ST?

Newsgroup: comp.sys.atari.st
Date: 1992-12-28 06:59:48 UTC
From: cctony@sun1.mcsr.olemiss.edu
Message-ID: <1992Dec28.065948.15771@ra.msstate.edu>
Source record: 212932

Ummm, my ST's 5 year old mouse finally died...
When it wouldn't move to the left without fighting it, I took it apart. My efforts to figure out what was wrong with it resulting in one of the plastic tabs that holds the spinning disk's axle in place broken. Thus my spinning disk no longer stays in... I have a couple of PC Mice laying around that I might be able to convert if I can get a schematic or a textfile explaining the conversion. I'm kinda handy with a soldering iron so I think I can do the changeout.

I checked out atari.archive for a textfile, but either it ain't there or I couldn't find it.

Thanks!

Infos about GFA Basic 4.0
-------------------------
GFA Basic will now develope by Richter Distributor germany. It will become
some new features:
- clear all known bugs
- adapt on new TOS Versions and new programming ideas
- new developing system with interpreter, compiler, editor, ...
- ...

The update/upgrade is for each GFA Basic User and will be for 70 to 100.- DM.

All registered User will become Informations about GFA Basic 4.0 for the
Atari computer system.
We are at the CEBIT 1993 in Hannover/germany.
If you don't regist by us you must do this now.

Bye,
LTS

Please send all messages as e-mail to Lars-Thorsten Sudmann @ RS.maus.de

Message-ID: <lahtinen.725533618@gideon>
Source record: 212935

RE: SCSI Lun#

I do not know about Supra but the drives I have seen from ICD all contain
an easy way to change LUN number. There is a scwitch back of drive whre
you can select any number (1-5,7 6 is for the clock). ICD can also boot
from any drive, so you could connect both drives on-line. The
only thing you must do is run HDUTIL to configure the boot-drive.
Perhaps it is necessary first to turn off the supra-boot.

7270. Need ST-to-NEC Multisync cable

Newsgroup: comp.sys.atari.st
Date: 1992-12-28 09:35:28 UTC
From: bbs.ruscal@tsoft.net
Message-ID: <THkHwB3w165w@tsoft.net>
Source record: 212936

Looking for a source to connect an ST (just color, though color+mono would be keen) to the original NEC Multisync.

The cable I had has mysteriously crapped out, and the Atari connector end is potted with goop so I can't see what the guy did inside. Of course I wasted about 4 hours cutting up the cable trying to find where the intermittent was; OF COURSE, it is somewhere in the Atari connector.

Sigh.

If there are instructions floating around, I can certainly make one, but I'll buy one if there's one available. The store I bought the cable from said it was a one shot deal.

Thanks.

In <rchan.2yl7@terapin.com>, Ronald Chan writes:
>Does anyone know if there is a utility that will extract *.Z compressed files
>on the ST? I see a few of them on umich archives. I am a total novice about
>the Internet, so bear with me while I ask dumb questions okay?

It means it's been compressed with the program "compress".
Usually programs that have been compressed with "compress" have been done
with "tar" first.
Tar put several files into one file, as compress can only compress the one
file, it doesn't group a few files into one archive.
Tar does no compression, hence then putting the files through compress.

The above answer is based on my personal experience only, and may be wrong.

If you can't find compress on it's own, then you'll find it in
one of the uucp archives (either hermes or mercury (rodneys uucp modules))

>virtually unobtainable through most of the country for those without
>Usenet access.

Yeah, hardware wise I would just ring up a company in the states, quote
my Visa number, and have it in anything from 5-12 days.
That's not too long to wait in your lifetime is it????
(oh yeah, get them to write "warentee replacement" or "gift" on it for you,
it avoids paying duty, but I never told you that trick ok!! :-))

>As a comparison, PCclone hardware is at most 10% more expensive, and Joe
>average user can get software at any local shop.
>
>Is it any wonder people don't buy atari in NZ?

Sure isn't. The people that own atari's are on the lower end of
the income bracket. The atari has an advantage that software is generally
small, and will run on the bottom of the range machine, single 2 sided
drive & 512K of ram using a TV. With a PC you need a lot more than
that for the basic machine.
This is now changing though, especially with the falcon.

For about US$1000 I could get myself a 386dx 40mhz, 80meg HD, 1.44 floppy,
SVGA card & monitor, mouse, case, 200W power supply, and I could
walk into _any_ computer shop for servicing, parts, or software.

The falcon has got sweet fa chance over here.... unfortunatly.

BTW: I'm not a supporter of any computer system over another, I remain
completly nutral, none of this message is intended as a flame, just the
facts. I don't think the new amiga's will have a lot of luck here either.

Craig.

7281. MiNT Distribution Kit

Newsgroup: comp.sys.atari.st
Date: 1992-12-28 19:41:50 UTC
From: mal5781@tamuts.tamu.edu
Message-ID: <1hnl9uINNsq3@tamsun.tamu.edu>
Source record: 212943

I was delighted to see the MiNT distribution kit on the Atari archive.
I download all the zoo'ed disks. I read all of the installation documentation.

However, when I try to use the SETUP.PRG program, it fails with 2 bombs.
I have been careful to clean out my AUTO folder and turn off every single
accesory. I am aware that AUTO programs and accessories cannot be used
with MiNT. After I have done all of that work, I still cannot get the
program to work.

Here is the advice I need:

I have TOS 1.00 and 2.5 Mbytes of memory (will be 4.0 Mbytes in a few
hours). I have an ICD cotroller for a 127Mbyte Quatum embedded SCSI drive
and a 65Mbyte Control-Data RLL (Adapter Controller) drive. IS MiNT or the
installation supposed to work with this setup?

What should I do to manually install the kit? How do I get the atari
to the point where I can use the MINIX file system for my partition F: and
install the software with a UNIX style user name?

Any and all help will be appreciated. I wrote the TeX installation manual
two years ago (everyone seemed to like it but CS-TeX's ease of use killed
the desire to manually install TeX), and I would not mind writing some
type of professional looking document to go along with manually installing
this kit. The best thing would be to have a working SETUP.PRG program for
all versios of TOS and the ICD device driver.

7282. A letter to Dave Baggett

Newsgroup: comp.sys.atari.st
Date: 1992-12-28 19:42:41 UTC
From: davidli@simvax.labmed.umn.edu
Message-ID: <1992Dec28.194241.1001@news2.cis.umn.edu>
Source record: 212941

Hi Dave. You are, of course, right. Atari stinks. Those people who have purchased an ST and who have hopes about the Falcon are lunatics. There will never be a release of Game Workbench for the Atari computer. The Intel-clone market is the only sane market for a programmer.

One of the converted.

Bob_BobR_Retelle@cup.portal.com writes:
>
>So, what is it that makes a computer "exciting"...?

IMO "exciting" computers are the ones that let the user be in charge. You buy a machine and you can decide what to do with it. That was one of the big principles of the home computer revolution. Rather than having to put up with annoying MIS-oids and system administrators, you could type in a word processor from a magazine--the key being that you could do whatever you wanted yourself. You had choice. That's where all the religious computer wars came from, people were defending their choices.

The mainstream PC market puts users back in the subservient position, or at least very far behind corporate interests. You have to upgrade your computer when you are told or you won't be able to run the latest software. You get tied to particular companies and have to respond to their every move. There is less competition--only two or three real choices when it comes to Windows word processors, for example.

You can dodge this nonsense, of course, making things a bit brighter. You can look into alternative products from smaller companies that give you more freedom. But if you choose this route you are basically in the same boat as ST users. You rarely find write-ups of smaller products in magazines. The companies don't have flashy four-color ads, etc.

>DigiSpec (and to think, I paid $50 for DigiSpec).

>What's the deal? I can accept that it didn't do it in IFF format, the docs
>say it doesn't handle every one, but it's supposed to do Targa files, isn't
>it? I mean, the option is there on the screen!

Well, I had a GIF that Pchrome 3.0 would not load, so I converted it to
a Targa file. Pchrome loaded it perfectly. I would say the problem was
with your conversion, or that you have discovered a new bug in the
program. (At least that I didn't know about.) It seems to have trouble
with certain images for reasons nobody understands. Guess it applies to
the Targa pictures too.

7286. file transfers

Newsgroup: comp.sys.atari.st
Date: 1992-12-28 21:04:05 UTC
From: wayne@bragg.bio.purdue.edu
Message-ID: <BzzMIu.5qy@mentor.cc.purdue.edu>
Source record: 212948

Hello to all,
Our lab needs to transfer files from Atari ST
(STe) machines to Mac II ci. The files are large and
are on 44MB syquest drives (250 -300 MB worth of info),
so using DOS formatted 720 K floppies is NOT AN OPTION.
We can take care of converting the data files to a format
usable on the Mac, the $64 question is how to port the data
from the Atari to the Mac.
So far we see two options.
1) Direct serial transfer via a lan or a null modem on the
Atari and the serial port on the Mac. For this we need and
information on modems and where to get terminal SW for the
Atari (preferably PD).

2) Create a DOS partition on the Syquest (any hints?) and
writing the data to that partition. The data could then be
retrieved by a Mac using Raccess PCS once a Syquest is
converted over to use for the Mac. The question here is,
can TOS recognize the Syquest partition and write to it?

If anyone out there has any ideas, information
(or better yet) practical experience with this sort of an
operation please E-MAIL me (wayne@bilbo.bio.purdue.edu).

Thanks in advance
Wayne
(wayne@bilbo.bio.purdue.edu)

I have another question...

What do you think of the A1200? I am a games player (I won't apologize for it - in fact in some sort of weird way I'm proud of it) and I think the IBM clone sucks as a games machine. If none ever get written for the Falcon, then it too, will suck. Is the A1200 the answer to my needs?

BTW - I don't especially like console games, and I do use my computer for other things, so I don't want a console.

THanks in advance for the info!

7290. Hard Drive (wierd) Problem - Help!

Newsgroup: comp.sys.atari.st
Date: 1992-12-29 06:13:42 UTC
From: mforget@elfhaven.ersys.edmonton.ab.ca
Message-ID: <H.eg.8xoBXXa8KAU@elfhaven.ersys.edmonton.ab.ca>
Source record: 212884
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi!

I think I might be having a problem with my hard drive. It used to only happen when it was cold in the room where the hard drive is, but now it seems to happen every time I turn the drive on.

The problem itself is this; after a few minutes of operating normally, it suddenly gets louder and sounds like it is working harder/going into Warp. It usually stops (then again sometimes it doesn't) if I tilt the front of the hard drive up.

The hard drive is an Atari MegaFile 30, by the way.

Do I need to clean the inside of the drive, or is it something else? Should I worry about this? The difference in sound is very noticeable (and there is a slight hissing as well).

Please help!

From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <72530@cup.portal.com>
Source record: 213002

You know, David.. probably the easiest and simplest thing for you to do would be to find an IBM users group in Milwaukee, and let them SHOW you...

If you can't find one, I've got a list of hundreds of them from all over the US.. I'm sure it must include some there.

I doubt that explaining to you the finer points of upgrading an IBM XT are all that interesting to the rest of the Atari newsgroup.

BobR

7292. KnifeST

Some mentioned that a Magazine had KnifeST on it,
can you Please restate witch one...??

I do have a real copy of KnifeST but its version 1.07..

I do hope that the later version has fixed the limitations
that I have found with it...

No Insert or Delete in the edit buffer, also Backspace and delete keys not
used..

Unable to print a page of the FAT table, you must print the lot..!!

Does not show cluster links for Directories, only files..

Does any one know if these faults have been fixed...??

I did write to HiSoft about the buffer problem, soon after I had brought
the software, but there reply was more or less they were not interested,
not what I would call good customer support..

Roger.............. sheppard_r@kosmos.wcc.govt.nz

Usually, the info line will be redrawn by the AES when needed. You can force
a redraw by installing a new (or even the same) string into a window's info line
with wind_set(WF_INFO, ...).

>
>Was it rabies that caused you to right Game Workbench for the Atari platform
>in the first place Dave?

No, it was a combination of good and bad luck. The key event was ownership of an ST in 1985. This was good (as far as GW goes) in that I would never have met Neil without owning one, and without Neil there would have been no GW for any computer. (Besides that Neil is an inspiring individual all around.)

It was bad in that it should have been a PC clone and not an ST. GW should have been written for the PC; had it been it would have been out months and months ago, and we might actually have gotten some return on our invested time (whether finanically or just in terms of the satisfaction of seeing people use it).

If I could do it all over again, I'd be tempted to replace that ST back in 1985 with a PC. (The money wasn't there to buy a PC system until much later.) The only reason I wouldn't is that it would cost me a friend.

Had I never met Neil, I'd probably wish I'd never even SEEN an ST.

>Really, Atari has ONE very GOOD advantage over other personal computer
>companies such as Apple. This is customer loyalty. And unfortunately,
>the company doesn't appreciate this advantage.

Yes, loyalty bordering on insanity. I'm getting flames from BOTH
extremes now (in email) -- the ones who say, "you idiot, why are you
bothering to try to convert these weenies," and the ones who say, "how
dare you tell me my computer's not great!" The irony is almost killing
me.

>>>"Yesterday's hardware at today's prices."
>>
>>Yes, there have been computers as powerful as the Falcon with all the features
>>it has, for years now, at sub $1000 prices. NOT!

Did I say that? No, I just said (and I still think it's a better
slogan for Atari now), "Yesterday's hardware at today's prices."

>>
>>>>Do you have a Falcon030 computer already?
>>>
>>>No, but I pretend to use one on TV. :)
>>
>>I thought you were given a Falcon by Atari when you went on your visit there...
>>Just kiding.

Well I WAS given a Falcon when I was there (OK, it was mailed later),
but NEIL has that one now, OK? Jeez.

>No, really, at the end of Dave's article, he wrote that Bill Rehbock
>gave him a Falcon030 because he felt sorry for them.

Ah-ah, I didn't say that was necessarily true; the fact is that I
have NO IDEA why Bill gave us a Falcon. That was only a theory
of mine.

>I'm wondering what happened to this Falcon? Someone else told me that
>Dave didn't get it because it was only Rev.2 or something like that and
>he was suppose to get a Rev.3 machine.

Look, Neil has had the silly thing since, what, August?

>positive things that we have as ATARI users.

What's wrong with doing both? Why should we pretend that Atari is
doing fine? Why should we allow more people to be deluded? Why should
we alloe Atari to get away with murder?

>And for
>those of you who have become frustrated with ATARI, and have moved on to other
>platforms should just stop posting in this group and post in the group of your
>own computer. I think we need to get rid of all of this negativity towards our
>computers and our computer company.

As long as there are people here with this fascist notion, I'll NEVER
stop posting the truth about Atari here. It is exactly when people
start painting a ridiculous rosy picture -- trying to rewrite history
and suck more suckers into a losing market -- that "those of us who
have become frustrated with Atari" feel compelled to inject some
sobering reality into the newsgroup. Sorry, but it's a free net.
I will NOT censor myself just because YOU can't stand to read bad
things about your company/computer/religion/etc.

>I read a message by someone who said that
>ATARI Corp has an advantage over the other platforms, which is its users
>loyalty. I think we need to keep this loyalty intact, and even increase it if
>we are to have what we want.

No, what you NEED to do is stop tolerating CRAP from Atari, thereby
forcing them to shape up or, as the the saying goes, ship out.

>Of course we all want something more from our
>computers, and I'm sure that this newsgroup will help you to find whatever you
>need in terms of information about what you can do to improve your system.

Right, and some of us who have strayed from the Rightous Atari Way have
contributed a lot of the help, information and software you refer to
here.

>So the bottom line is: GO ATARI!

I would LOVE to see Atari thrive again. If they could turn it all
around (e.g., by selling the company to competent management), I'd be
their biggest fan again.

Considering that this is the comp.sys.atari.st newsgroup, it would
seem rather strange if you were waiting here for announcements on
intel-related stuff. You may wish to unsubscribe here and subscribe to
comp.sys.ibm.pc, as they would more suit your needs. Why waste
time reading all this Atari stuff if you are obviously not interested
in it anyways. Oh well, back to reality...

Hi,
Is there anyone who can e-mail me a list of ST-Software that
can run on Falcon030?

Thanx,
Roberto Bertucci.

>the DSP 56001. Your statement is more than misleading unless you can
>prove that the cards mentioned above are not 16-Bit with 44.1 Khz capabilties.

>Mark K.

One of the best selling Soundcards on PC are the SoundBlaster 3 and 4.
Both claim to be able of doing samples with 25kHz or more - that does
not matter. Fact is:

SoundBlaster 3 cuts of frequencies at about 6kHz (at least they are
down 10 db!). SoundBlaster 4 does the same at about 10 kHz.
They may need as much RAM for their samples as for 44.1kHz, but they sound like
using only 6kHz.

I'm only quoting c't. This sould be a good source for information.

Certainly there are also some good cards, like the one for about DM 1500
using a DSP and M68000. The problem is: It is as expensive as the
whole FALCON :-)

The cheap cards are also not able to do harddisk recording and I don't
think they have DMA access to the RAM, to a DSP and so on. And you
won't find build-in DOS routines for using theses cards easyly.

>Are the Falcon's modes (3 of them anyway) compatible with TT-low/med/high?

You don't have TT-low and TT-high on the Falcon 030.

>Also, is the 040 a 32Mhz processor? If so, I'll buy that instead of the
>Falcon 030.

Normally the 68040 runs at 25MHz. But there exists a version for 32MHz.

mackie@meena.cc.uregina.ca writes:

- I have another question...
-
- What do you think of the A1200? I am a games player (I won't apologize for
- it - in fact in some sort of weird way I'm proud of it) and I think the IBM
- clone sucks as a games machine. If none ever get written for the Falcon, the
- it too, will suck. Is the A1200 the answer to my needs?
-
- BTW - I don't especially like console games, and I do use my computer for
- other things, so I don't want a console.
-
- THanks in advance for the info!

Stay away from the A1200 like the plague!!!!! Preliminary reports from
Europe say that a lot of the software written for the A500 is trashed on
the A1200. There are lots of compatability problems with the A1200, so
it is not a viable machine to buy. If you don't believe me, check out
COMP.SYS.AMIGA.* for yourself.

>
>Well at least you're beginning to sound reasonable.

Dave, why don't you just leave it alone?

About 80% of the people here realize the problems with Atari, etc.

I don't own my Atari because of the Tramiels. I don't own it because
of Atari's management.

I really own it because of people within the Atari Community.
They just can't be beat.

I have a lot of good friends that own Atari computers and I find them
to be very spirited and enthusiastic. I can't say the same for
those that seem to think completely with logic saying,

"If Atari's management is getting themselves together, sell your
computer and go with the flow--IBM compatibles."

I also tend to like Atari developers. They too seem to be very
special people.

I also own my Atari because the machine isn't really a bad machine.

If Atari had very GOOD management with a poor Atari Community, I'd sell,
of course it would be nice for both...

Source record: 213024
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Question:

I just got a Syquest 44 removable HD for Xmas and I am running into a curiosity. When the drive gets up to speed and I turn on the ST, it boots to floppy, but from then if I reset it, it boots from the 44! It is strange and I have no problem with it, I just find it a little confusing. Oh, by the way, it is a SCSI 44 with the LINK attached.

Any help in this querry isgreatly appreciated.

Len Stys writes:
>
>I really own it because of people within the Atari Community.
>They just can't be beat.

Well said. Right now, I don't even own a working ST (don't
throw things, please!), but I still like to keep up with the
ST community because it is fun and I like the general Atari
owner spirit. I subscribed to _Atari Classics_, the started-in-1992
magazine supporting Atari *8-bit* computers for the same
reason. (Yeah, it's outdated technology but I don't care.)

>I also tend to like Atari developers. They too seem to be very
>special people.

People like Charles F. Johnson, David Small, and Dave Baggett
are well-known developers--people, not just faceless corporations.
They tend to listen, to care about their products; you feel that
when you purchase something from them you are supporting a good
cause and making a difference. (I know, making money ain't
easy; working PC territory would be more profitable.)

>I still think that clones are pretty damn boring.

I think a subset of clone owners are similar to Atari owners,
but they are buried beneath all the nonsense and consequently
much less visible--and they don't have any kind of impact on
the market.

7315. Need mor ehelp with Lattice C 5.0

Newsgroup: comp.sys.atari.st
Date: 1992-12-29 21:33:10 UTC
From: wilsont@rahul.net
Message-ID: <C01IJB.339@rahul.net>
Source record: 213026

I just got lattice installed on my system, and there are a few questions
i'd like to know from people who've successfully got this thing to work.

I've been using sozobon 1.44i (heat n' serve) since the beginning, works
great. but i have lots a problems with lattice.

1. I can't seem to get what i want out of lattice,
i would like to have: 16 bit ints, 32bit adressing.
i'm using make.ttp and so i have it compile with -b0 -r0,-w flags.
then i have to clink.ttp csnrb.o and lcsnrb.lib to it right?
so far, nothing has compiled correctly!

2. i also tried 32bit ints, stuff compiles, but bus errors and other nasty
things occur when i pass big ints to vdi calls and such.

3. i converted a program of mine from 'int' to 'short' declarations
and used -b0 -r0, everything compiles, but the linker bombs out!! (bus error)

also, the docs are very vague when it comes to multiple module programs,
so maybe i'm getting something wrong.

is lattice written for small one module programs? why does it default to
relative adressing? (thats intel crapola!)

lastly, what about GNU c? what are its deafults?

thanks for the help!

k>Thanks for the tip. Can you give some info on how this adaptor works?
k>Will software properly recognize the higher rez? (I guess this means
k>a VDI driver that only well-written GEM programs can use?)

It supplies a higher pixel clock rate into the Falcon030, thus making higher scan rates possible. The Falcon's VDI will use the higher resolution, and programs that use AES and VDI also will.
(Programs that do not use AES and VDI very probably won't run on normal Falcons anyway...)

7325. Falcon needs....

Newsgroup: comp.sys.atari.st
Date: 1992-12-29 23:39:19 UTC
From: wells_s@kosmos.wcc.govt.nz
Message-ID: <1hqnj7INN7jq@golem.wcc.govt.nz>
Source record: 213034

Okay, the falcon needs:/ (and can easilly do - so get to work guys 8-)

16-colour ANSI emulation. (With all the standard extras, bold, blinking etc.)

MS-Doze compatible Super-Z-Modem, Bi-Modem & HS-Link Transfer Protocols. (Not difficult these days, especially with the Falcon's DSP, which should be able to happily handle data going in & out at the same time....)

Answer Phone. (Plays a pre-recorded sample when someone calls 'I am not home... etc.' - and then records (samples) the callers message, at a low rate to keep filesize down!)

VGA art package, supporting GOOD picture resizing & dithering, so as to expand SpeCtrum 512 320*200*512 pictures up to 640*480 etc. resolution, (this CAN be done with virtually no loss of detail whatsoever, the OLD mac-plus has software which does it with INCREDIBLE results - and it's shareware!). Should support GIF, IFF, maybe TIFF, and the standard ST-assortment (Degas, Neof r
ST-assortment, (Degas, Neochrome, SPectrum 512 etc.)

Comms with DSP data-compression/decompression/error correction. (e.g. MNP 1-5). Using the DSP to compress/decompress data, and perform Error correction, and then send the data to the modem, or to the rest of the computer. Disablable in case of real Modem-based MNP being present! This would REALLY hit the spot!!

Also - has anyone done any DECENT compatibility tests with the new Falcon 030, e.g. testing a reasonably wide variety of Public-Domain/ Shareware and commercial software. Particularly programs using the sound-chip, which apparently has problems.

Also, can anyone give us a good description of the software packaged with the Falcon, not just what it is, but what it does!

C'mon you people, if you own it - let us hear about it!!

And, why isn't there a comp.sys.atari.falcon message base?? Amoeba games machine has around 10 message bases! Surely 4 atari bases wouldn't hurt! (1 8-bit, 2 st (tech and this base), and falcon). Pretty harmless, considering the other assortments of pointless message bases around, many of which have never had anything posted in them!!

I have a set of Tos 1.04 chips for sale at $40.00 .
This is the 6 chip kind NOT the 2 chip.
They are marked with the U numbers 2-7 so easy to install.
I also have a Beetle mouse for sale Make a offer on the Mouse.

7328. LodeRunner's Revenge (lodeclon on atari.archive)

Newsgroup: comp.sys.atari.st
Date: 1992-12-30 01:38:57 UTC
From: John.Klassa@launchpad.unc.edu
Message-ID: <1992Dec30.013857.12330@samba.oit.unc.edu>
Source record: 213037

Hi-

I just downloaded lodeclon.arc from atari.archive... It's a LodeRunner-like game. It seems like a decent game except for the fact that it takes _forever_ to get from one screen to the next, and it takes forever to start the game. Example: when your player dies, the game sits for about 10 or 15 seconds -- doing absolutely nothing. Then, finally, it clears the screen and draws the next one. Likewise, when you start the game, it sits for many, many seconds before throwing up the game screen. None of the keys seemed to have any effect. Has anybody else noticed this? Is there anything I can do to circumvent the delay?

Thanks!

John

P.S. PLEASE reply to klassa%aurfs1.aur.alcatel.com@rockdal.aud.alcatel.com instead of replying directly to this address (john.klassa @ bbs.oit.unc.edu). I'd have posted from the aur.alcatel.com machine except that ours news server died. I'm still able to receive mail that way, though, and would appreciate getting responses there instead of here.

The latest Z*Net has some GEnie messages in which Ron Robinson, who is reviewing a Falcon for Atari Explorer, explains some of his experiences with it. He mentions software compatibility and some of the software that was bundled with it.

The mag contains a offer to buy the KnifeSt manual plus "a coupon
which enables you to upgrade to KnifeST 2 when it becomes available"
for 14.95 pounds.

To answer Roger's earlier question, I enclose part of the REAME.TXT
file which was on the diskette.

```
------------------------------------------------------------
KnifeST version 1.10 Read Me 23 May 91
==============================

Please state the above version number on your registration card.

New features of version 1.10
============================
This version fixes a problem with incorrectly generated 'Media
Change Errors' when searching on some floppy disks.

New features of version 1.09
============================
The Disk Info command from the Show menu now supports volumes bigger
than 16 Megabytes.

New features of version 1.08
============================
Certain non-standard floppy disk formats with a particular FAT usage
caused incorrect calculations in all the analysis functions resulting
in an internal error *3* alert to be generated. This has been corrected.

Logical Sectors > 512
---------------------
These are now handled correctly.

There is a new program for some hard disk owners AESPATH. See the
text file in its folder for details.

New feature of version 1.07
===========================

....
------------------------------------------------------------
```

Source record: 213042

Sorry, I need more specific information about the TeX-Version.
There are at least 3 different TeX-implementation available:

Lindner-TeX, Version 3.141 / 2.2
CS-TeX Version 4.05 ?
Multi-TeX Version 5.04 ?

If you use Lindner-Tex, there is a nice shell which controlls everything.
You 'll have to start IniTeX at least two times with PLAIN/ENGLISH and
LATEX/ENGLISH to get the format (.fmt) files which contain essential
informations for TeX.

In article <1hq32sINNsuv@usenet.INS.CWRU.Edu> aa399@cleveland.Freenet.Edu (Len Stys) writes:
>Dave, why don't you just leave it alone?

Because people still say things like:

>I really own it because of people within the Atari Community.
>They just can't be beat.

Those people are leaving! Your developers are jumping ship! Your shareware authors are getting sick of Atari and going to other platforms. Jeff Minter's done Llamatron for the PC -- that's a bad sign for the community right there, isn't it?

The number of Atari owners is dwindling at a steady rate. If those of you who can still find it within your hearts to support Atari to the death don't find any way to make Atari get a grip, you will see your community shrink to almost nothing.

It's a lot less fun when no one's left to write ambitious new software.

>I have a lot of good friends that own Atari computers and I find them
>to be very spirited and enthusiastic. I can't say the same for
>those that seem to think completely with logic saying,
>
>"If Atari's management is getting themselves together, sell your
>computer and go with the flow--IBM compatibles."

See? You ask why I contuinue to argue about this stuff, and then write things that indicate you have an overly optimisitc view of the situation. The fate of Atari machines is in Atari's hands, not yours. If Atari allows themselves to self-destruct, there won't be any commercial devlopers left. What percantage of the group is going to stick around once the Atari is REALLY an orphan machine?

>If Atari had very GOOD management with a poor Atari Community, I'd sell,
>of course it would be nice for both...

You are typcasting. Atari owners are as diverse a lot as PC owners. Do you think all PC owners are mindless droids? All Amiga owners are childish brats? These stereotypes whiz through this group frighteningly often.

>I still think that clones are pretty damn boring.

With my 486 I can compile things really quickly, run a full Emacs implementation that is considerably faster than Tempus, archive and

unarchive things blindingly quickly, and program it to put pretty pictures on the screen and make neat sounds.

In short, I like it for the same reasons I like my ST, except that it's a lot faster and you can buy 5,000 times as much software for it. Not only that, but there's some chance in hell I might actually be able to make a living writing software for it.

Clones are not boring at all to me. There's exciting new free, shareware (Llamatron!), and commercial software coming out every day that will run on my "boring clone." There are hundreds of neato cards I can put in it, like a studio quality sound board, an ethernet card, a graphics accelerator that supports TIGA (a standard -- imagine that), a RISC coprocessor board, etc.

Atari can't just sit there and watch the world fall apart while their devoted fans make excuses for them. They need to start making competitive machines again, and they need to start selling those machines.

OK, how's this... in preparation for this year's Winter COMDEX in Las Vegas, L_____ came up with the brilliant idea of having the developers (who always help man and populate the Atari COMDEX booth) *pay* for the privilege of helping Atari sell their computers! This would be over and above the expense of transportation to and from Vegas, meals and lodging, the very costly glossy brochures required of each dev in the booth, etc, etc.

Fortunately, someone in Atari convinced him that this probably wasn't too good of an idea and might further "alienate" the few remaining Atari devs. :) Even so, dev support at this year's COMDEX was *very* spartan as compared to previous years. Gee... I wonder why? ;-)

Message-ID: <1992Dec30.175909.2268@zooid.guild.org>
Source record: 212960

Has anyone out here experiemented with TCP/IP for the Atari ST. I remember seeing a file on a german FTP site that was called, I believe, TCP_IP.LZH. How does it implement TCP/IP? Is it done via the RS-232 port? What I want to eventually do is to network my PCs with the Atari that I have. Is there any product that will allow me to do it? Since I am running OS/2 2.0, I would want to be able to monitor the Atari machine by having a window activated all the time in order to do so. To go even further, any products for the Atari ST that will allow it to network with IBM's LAN Server?

Any information is appreciated...

Mark K.

7347. Game Workbench, Dave B and other things...

Newsgroup: comp.sys.atari.st
Date: 1992-12-30 21:15:40 UTC
From: sam_s@NeXT.com
Message-ID: <6130@rosie.NeXT.COM>
Source record: 212959

An observation: Game Workbench sounds great. I would love to have it on my PC or my NeXT. A few years back I would have loved to have it on my ST. I would argue that the Atari is a great place to pick up programming experience in graphics and small operating systems; most of the great Atari programmers have been able to use their skills as a basis for lucrative jobs on other platforms. It's also a comparatively painless marketplace to learn nasty business lessons; sure you've wasted your time (haven't we all...) but you're wiser and I doubt you're several hundred thousand dollars in debt, which is the cost of failure in marketplaces with higher expectations.

I'm sure your experience in graphics, engines, and object libraries will serve you well. Perhaps GW-PC? GW-Genesis? Perhaps another product entirely, but the important thing is to pick up the pieces and take advantage of your experience.

I just remembered a great quote from Sam Kinnison (rest his soul):
"Of course you're starving, you live in a $#@*&% desert! Move to where the food is!"

Many of them haven't left YET. They are waiting for the "dooms day"
that you claim will be coming soon.

This might be the case. In fact, I agree that it will happen unless
someone else takes over Atari or drastic changes are made.

But, I figure that Atari will be around for at least until 486'
computers become affordable. And I'll wait until then.

>
>The number of Atari owners is dwindling at a steady rate. If those of

Dave, ATARI is in my blood. And I want to be around for the day that
the company dies.

I'm sure that the others that you are trying to convince feel the same way,
so it is useless.

I'm in no hurry to jump boat unless I'm POSITIVE that there is no
fun or future.

>
>It's a lot less fun when no one's left to write ambitious new software.
>

There will be a few nice products for the Falcon030. I'll wait and
see what Atari does with it before leaving.

>>I have a lot of good friends that own Atari computers and I find them
>>to be very spirited and enthusiastic. I can't say the same for
>>those that seem to think completely with logic saying,
>>
>>"If Atari's management is getting themselves together, sell your
>>computer and go with the flow--IBM compatibles."
>
>See? You ask why I contuinue to argue about this stuff, and then
>write things that indicate you have an overly optimisitc view of
>the situation. The fate of Atari machines is in Atari's hands,
>not yours. If Atari allows themselves to self-destruct, there
>won't be any commercial devlopers left. What percantage of the
>group is going to stick around once the Atari is REALLY an
>orphan machine?

Oh, sorry, I meant to say, "If Atari's management is not getting themselves
together, sell the computer and go with the flow--IBM compatibles."

I deal with IBM clones ALL of the time. The computers aren't that
fantastic--even the 486's.

But that is where your BIG bucks come in and that is the only thing I see
exciting about the 486's for developers.

Besides, nobody will APPRECIATE developers in that big ocean of
the compatible world.

I at least know WHO you are, who Dave Small is, and the other developers.

>
>>If Atari had very GOOD management with a poor Atari Community, I'd sell,
>>of course it would be nice for both...
>
>You are typcasting. Atari owners are as diverse a lot as PC owners.
>Do you think all PC owners are mindless droids? All Amiga owners are
>childish brats? These stereotypes whiz through this group
>frighteningly often.

No I'm not. I'm sure there are SOME spirited and enthusiastic
IBM compatible owners. I just don't know who they are. They are lost
among all those that care more about THEIR productivity than OTHERS.

>
>>I still think that clones are pretty damn boring.
>
>With my 486 I can compile things really quickly, run a full Emacs
>implementation that is considerably faster than Tempus, archive and
>unarchive things blindingly quickly, and program it to put pretty
>pictures on the screen and make neat sounds.
>
>In short, I like it for the same reasons I like my ST, except that it's
>a lot faster and you can buy 5,000 times as much software for it. Not
>only that, but there's some chance in hell I might actually be able to
>make a living writing software for it.

And your 486 cost about $1,500 more than the ST. $1,500 more than
some of us can afford or are willing to pay for a computer.

>
>Clones are not boring at all to me. There's exciting new free,
>shareware (Llamatron!), and commercial software coming out every day
>that will run on my "boring clone." There are hundreds of neato cards
>I can put in it, like a studio quality sound board, an ethernet card, a
>graphics accelerator that supports TIGA (a standard -- imagine that),
>a RISC coprocessor board, etc.
>
>Atari can't just sit there and watch the world fall apart while their
>devoted fans make excuses for them. They need to start making
>competitive machines again, and they need to start selling those
>machines.
>
>Dave Baggett

You are right about Atari's management. Something needs to change.

I've tried my best... We'll see.

7350. Re: GIF convertors

Newsgroup: comp.sys.atari.st
Date: 1992-12-31 01:19:00 UTC
From: apelled@cix.compulink.co.uk
Message-ID: <memo.834515@cix.compulink.co.uk>
Source record: 212968

In article <1hal4hINNsjh@golem.wcc.govt.nz>, wells_s@kosmos.wcc.govt.nz (steve wells) writes:
>>Does anyone know of a program to convert GIF files to ST formats
>>(Neo or Degas preferably) - I know that information will be lost,
>>but I want to be able to load stuff up quickly, and as long as
>>the picture looks vaguely OK it doesn't matter.
>
>Fast-GIF is, (as it says), very fast, and does a pretty good job of
>converting any GIF picture into 320*200*16! (And saving it in
>Degas PI1 format if you want.) It doesn't handle JPEG, or this 89a
>format. (The new one), but it works fine with 90% of GIF's!
>(1meg at least recommended, as with all GIF programs, those things can
>use a lot of RAM!)
>
>Fast-GIF is on atari.archive.umich.edu in the graphics section somewhere
>(or was).... it should be available locally as well. (just about anywhere)

Also it is perfectly acceptable to change the gif signature to 87a. The GIF spec allows this, just some of the 89a features will get skipped. That is of course if it was implemented correctly.
In fact a pedant might argue that GIF is the signature not GIFxxa. A lot of viewers say 'not a gif file' when in fact they mean 'not a fully supported gif file' :-)

Adam.

7351. Fax Modem

Newsgroup: comp.sys.atari.st

Source record: 212970

```
They are written to in the same manner as disk files.

REWRITE(file, filename);

where file is of type TEXT and filename is a filename on the disk, OR
one of the following: PRN: AUX: CON: MIDI:

For example, to write 'HELLO' to the serial port,
file: TEXT;

REWRITE(file, 'AUX:');
WRITELN(file, 'hello');

I hope that answered the question.
```

7353. Driver of the 640MB Optical Drive

Newsgroup: comp.sys.atari.st
Date: 1992-12-31 05:50:48 UTC
From: akisujar@nuscc.nus.sg
Message-ID: <1992Dec31.055048.6735@nuscc.nus.sg>
Source record: 212971

Hello from Singapore,

I have tried connecting a Sony 640MB Optical drive to the Atari TT via SCSI port as well as to the Mega4 via DMA/SCSI adapter last night.

I cannot get both computers to recognise the drive with ADHI program, obviously I will need a proper driver to format the Optical Cartridge as well.for .

Is there a Formatter/driver programs available anywhere? Either commercial or shareware is fine for me?

Would the software supplies with the new ICD LINK hard disk adapter support 640MB (5-1/4") Optical drive? I would not mind buying a LINK if it works.

Another possible cause may be that the Optical drive that I have is set with Parity enable. (I know from my pass experiences with connecting Syquest and other hard disk to Atari that I have to disable Parity of the hard disk to get it to work) My next (and last) question is which jumpers on the SONY optical drive is for Parity setting.

Any suggestion would be much appreciative,

Suthipuntha, School of Architecture, National University of Singapore

7354. We have reignition

Newsgroup: comp.sys.atari.st
Date: 1992-12-31 06:31:07 UTC
From: healy@nosc.mil
Message-ID: <1992Dec31.063107.20359@nosc.mil>
Source record: 212972

I've tried to stay out of the lharc-zoo flamewars, but I need this catharsis. I have been using lharc201i for a while and it has always worked until today. Today I figured that I better upgrade to lzh20ik, just to be on the safe side. Well, lo and behold, my current lharc choked on some files, so I guess my timing was right.

So what happens when I try to extract lzh201k? lharc201i chokes. Now, we're not talking about lharc1.0 or something. There should have been (at most) one minor revision between the two.

Do I really need 201j to unlzh 201k and is 201i too "out of date"? IF this is the case, and my problem wasn't caused by cockpit error, which is entirely possible, then I think that these lzh guys have lost sight of the purpose of utilities in the first place. The idea behind the lzh is to allow people to share files (compression makes it easier to download files). It is a utility. I personally don't care if the version I have will create subdomain crosslistings and hierarchical bitbuckets :-) If -extract will work, I could live with that. I can accept creating newer versions with more bells and whistles as long as the basic functionality is preserved across all versions. But this situation is ridiculous. I want to use lzh to access files. I don't want to spend my time racing to keep up with the latest version which is incompatible with anything that came before.

People that upload .lzh files that they want the st community to see should consider my reaction to a file that uses a newer version of lzh and so I can't uncompress it - you know that trashcan on the corner of the desktop? :-) My point is, if you want a lot of people to access your software, you're better off putting it in a form people can access.

And now my lharc flame:
I have NEVER been unable to uncompress a file with zoo.

]
] While still an ST supporter (I'd like to get a '40 Falcon if the beast ever is released),
^^
] I have noticed a lot of people have disappeared from this group over the past few years.
]
] Mike Healy
]
] healy@nosc.mil
]

Your message makes the point that has put me off Atari for a long time now. There is NOBODY in the PC world who is saying "if the 586 (or whatever they are calling it) is released." Its not a worry. I've supported Atari since 1983 when I bought my first Atari 400. They are great computers but I cannot spend the rest of my life wondering if there will be any support for my computer 12 months from now. Granted, the Falcon looks like a great machine, but if it doesn't make it that's basically it for Atari. I don't want to sink $1000+ into a computer when the chance of it being supported in a year is 50/50 at best. For that same $1000 I can buy a PC compatible which will be supported into the next century AT LEAST. The features and capabilities of the Falcon simply do not justify taking that sort of a gamble.

ITS REALLY NOT THAT IMPRESSIVE!

Nifty toys like the DSP are not going to grab the mass market and that is what Atari has got to do to stay in business. Sorry, but my next computer will be an Intel machine. Maybe then I can sleep at night.

:EMILY:
Hints from Emily Postnews
==========

(Thanks to John Henders (jhenders@jonh.wimsey.bc.ca) for this bit of
humor.)

Emily Postnews Visits comp.sys.atari.st

(Due to popular demand, (well at least one persone asked anyways),
Emily has taken time out of her busy schedule to answer a few commonly
asked questions specific to c.s.a.st.)

Dear Emily.
Some Amiga user is raving on c.s.a.st about how wonderful
his computer is, and how awful mine is. What should I do?
signed My Computer is NOT a Toy.

Dear My Computer, etc,etc.
Many people's egos are so tied to their possessions, they
have to affirm their existance by raving about the superiority
of their machine to anyone who will listen. You should immediately
flame these people into cinders, using every rumour or misconception
you've ever heard about their brand of computer, as this will cause
lots of posts, and develop into a massive flame war, which is one
of the main reasons most people read c.s.a.st. If this didn't happen
every six months, everybody would unsubscibe to this newsgroups from
boredom.
Or, you could put comp.sys.amiga.advocacy in the Followup to:
line, and any article replying to yours would go to the newsgroup
designed for this discussion.
Or, if your newsreader supports it, you could build a KILL FILE,
which eliminates any post that has the word Amiga in it.

Kill files can be created in rn and trn by hitting the 'K' key.
This will make a kill file based on the article you were reading
at the time. Then control K will put that file in the editor for you
to play with. You use the same regexp commands here that are in rn.
For example. /[Ff]oo/h:j would search all headers of unread articles
for both Foo and foo, and junk them. Check the docs for your newsreader
for further details.

Dear Emily.
I like flame wars, and want to start one of my own, so my name
will be as famous as Richard Covert's.
Signed, Too much Time on My Hands.

Dear Too much time.
Sorry it took so long to reply, but Richard's in my kill file
and someone had to forward your post to me, or I'd never have seen it.
Flame wars are fun. They're the main reason people creted Usenet,

and should be encouraged at every opertunity.
Some of the most common tricks for starting flame wars are as
follows.
1: Post a note in another newsgroup telling all the users there that
they own a piece of junk, and if they had a half a brain, they'd have the
same computer you do, as it's obviously the best.
2: Toss a bit of slander against another computer in a totally
unrelated post. This guarantees a follow up, even if your original
post wasn't of any interest.
3: Create a signature file that has a put down of another computer
in it. This will get flame wars going in threads that have completely
unrelated Subject: lines, thus slipping through all but he most exacting
kill files.
I hope you find these tips handy in creating your next flame war.
And just remember, your computer MUST be the best, after all, it's yours.

:DEV:
How do I become a developer for the Atari ST?
==========

Contact Gail Bacani, Atari Rep Person, (408)745-2022

[UNITED STATES ONLY. IF YOU LIVE OUTSIDE THE UNITED STATES, CONTACT
YOUR COUNTRY'S ATARI HEADQUARTERS FOR MORE INFORMATION.]

Gail can explain the program to you, and send an information packet if you
desire.

Atari has gone to a 2-tier developer membership. The 'higher quality'
developer support goes to commercial developers, and costs $250. The
'no-hand-holding, no announcement of company future products, no access
to discounted hardware' goes to noncommercial developers, at an initial cost
of $125, plus $50 renewal fee each year.

Both tiers receive the ST/TT Developer Kit and all developers have to fill
in an application form and a non-disclosure agreement. Contact Gail for
more information.

Atari is now selling the developer's kit (or parts of it) seperately. No
project-in-development or non-disclosure agreement is necessary.

:ERR:
What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

The information below was written, in part, by Darryl May, and posted on GEnie in January (of ????) by John Townsend. The original also appeared in the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA 22170). It has since found its way to me, and is being posted to comp.sys.atari.st as a service to readers.

Alan Pratt wrote to tell me that the basic information may be correct, but that it cannot be dubbed "official" unless it originates, on paper, from Atari. This makes sense, as electronic communications are easily modified, even accidentally.

Roland Waldi provided information regarding the difference between TOS and GEM return codes which appears to be correct. The tables have been modified to reflect his information.

The following is an unofficial list of the errors that can appear while you are operating your ST computer.

Error description return code alert box #
==========
OK (no error).....0
Fundamental error.....-1
Drive not ready.....-2
Unknown command.....-3

A "Remodeled" Atari S.I.G. Opens

By now many of you have heard of the Cleveland Freenet, or more specifically the Atari S.I.G. on the Cleveland Freenet. For those who haven't, the Cleveland Freenet is an experimental computer system providing free public community telecomputing. Basically, it's a lot like a public library of the future. Many of these systems are popping up all over the country. Don't be surprised if one pops up in your neighborhood in the future.

Recently the Atari SIG has undergone a significant face-lift. All the regular areas are intact including its news sections, user group newsletter, online magazine sections, general as well as specific computer discussion boards (8 bit, 16/32 bit, Lynx, Portfolio), and our weekly Sunday night multi-chat conference.

The conference starts at 8pm EST sharp and is on channel "+Ataricon". What the staff at the Atari SIG has added, has given the Atari SIG the potential to cover all grounds of Atari and its related products.

The most noticeable addition to the Atari SIG is the Programming and Development Forum. This forum is intended to be used by developers, professional programmers, and Atari hackers (the old definition of "hacker") as a means to share ideas, help each other out, and find out the latest technical information on Atari's products. This board is ran by newly acquired SIG Operator, Peter Haller, a professional programmer who is running developer sections on hardware and software development, programming, MIDI applications development, Graphics Design, plus many other sections that can definitely become a programmer and developer's dream come true!

Last, but definitely not least, the Atari SIG has a restructured Product Info and Support Board and a new Special Applications Board. The Support Board includes a vast library of support lists. These lists range anywhere from phone numbers of Atari dealers and producers, to software reviews for 8 bit, 16/32 bit, Lynx, and Portfolio software. To sum it all up this area covers what's out there, who makes it, and how to get it for all Atari products. The Special Applications Board is just starting out. Currently there is an area for users of MIDI on the ST. MIDI users are encouraged to use this as a means to discuss MIDI related topics. This section is expected to expand in the future.

Accessing the Atari SIG has never been easier. One can access it via Internet by telenet'ing to 129.22.8.75 or "Freenet-in-b.cwru.edu" or by calling (216) 368-3888 300/1200/2400 bps. Once on the system, a user can apply for an account application and logon as a visitor. Once here, simply type "Go Atari" to get to the Atari SIG. A visitor can go anywhere on the Freenet and can read anything. They can't post messages until they get their permanent accounts, however.

For additional information on obtaining access to Freenet write to myself via the e-mail addresses above or by writing the SIG at its US mail address:
The Atari SIG

P.O. Box 21815
Cleveland, OH 44121 USA

Lastly, a freenet application is available in the mail by writing a
request to the above address if you rather not download it from Freenet.

The Atari SIG is ready to serve the thousands of Atarians throughout
the world. We look forward to seeing you all real soon! Remember the
staff of the Atari SIG are volunteering their time for no pay and the
Cleveland Freenet, as well as the Atari S.I.G., is a non-profit organization
existing for the free exchange of information.

--

:MAGS:
What magazines are available for the Atari ST?
==========

If you've got updates, mini-reviews,
or more information on other magazines, please send them to me via e-mail.

As always, WRITE to a company before sending them money for a subscription.

US mags:

AtariUser, published by Quill Publishing Company

Cover Price: US $1.00 Canada $1.45 UK 1.50 (AtariUser is available for free
[$6.00/50 magazine shipping charge] from participating computer dealers,
bookstores & user groups!)

Subcription Rate: $21.30 US Bulkrate, $41.30 US First Class.
Address: AtariUser, 113 W. College Street, Covina, CA 91723 USA

Current Notes, published by Current Notes Inc.

Cover Price: US $3.95

Subscription Rate: $27.00/year (Atari clubs registered with Current Notes may
subscribe at $23.00/year) US, $35.00/year (Canadian club members at $31/year)
Canadian, Foreign rate $44/year.

Address: Current Notes Inc., 122 N. Johnson Rd., Sterling, VA 22170 USA

Atari Interface:

Write for a free sample copy of the Atari Interface magazine
(Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108)

AIM is soon to be available in Canada, Europe and Mexico, and should be in all local WaldenSoftware stores and many bookstores. If your "local" Atari dealer doesn't have it, he should be able to get it for you...

UK Mags:
(Thanks to Sam Marshall <samm@castle.edinburgh.ac.uk> and Kevin Busby <kevinb@syma.sussex.ac.uk> for some of the info here.)

ST Applications:
---

formerly the ST Club Newsletter, this is now the only non-games mag in the UK (although see ST World below). Approx. 4,500 copies per issue sold. News, reviews, interviews, tech tips, general forum, programmers' forum, PD catalogue. DTP'd on an ST. Retains a 'user-driven' feel. Recommended. The associated ST Club runs a PD distribution service and distributes a couple of commercial programs too (Fontkit Plus, UIS III, Molgraph, CRL Virus Killer, etc.).

Subscription costs: UK - 15 pounds; Europe - 18 pounds (Air Mail); worldwide - 28 pounds (Air Mail)

Address: ST Club, 2 Broadway, Nottingham, NG7 1PS, UK.

ST World:
---

formerly the leading UK non-games mag. Became a quarterly 'buyer's guide' in Autumn 90. Now, allegedly, about to be revived as a monthly (under the stewardship of Jean Gollner, mother of ex-editor Hugh) in the wake of Atari UK's new push into the 'serious' market.

ST Format:
---

all-purpose 150-page monthly, mainly aimed at young people. Lively, but of uneven quality. Big leisure section, but other areas covered too. Includes cover disk - mix of games demos and (usually out of date) PD utilities. Probably the biggest-selling UK ST mag. Has had several public rows with Atari UK.

Future Publishing, Somerton, Somerset, TA11 6TB Tel. 0458 74011
Fax 0458 74378

Atari ST User:
---

like ST Format. Generally (amongst online users) thought to be not quite as good.

ST Action:
---

games, games and more games. And games.

Atari ST Review:

Lots of info, more mature editorial style than Format, but not so polished. 2 cover disks per issue.

Subscriptions: PO Box 500, Leicester, LE99 0AA. Tel: 0858 410510.

There are also, I think, some MIDI mags with strong ST content. I don't have their names.

German Mags:

Atari PD Journal:

Reviewed in the May '91 issue of Current Notes [from which I'm cribbing this information, DP-Z]. Hardware and Software reviews, some commercial software reviewed. Typical issue runs around 90 pages. Special "Katalog" section.

Subscription: DM 70 (normal mail), DM 100 (air mail). Prices may be for domestic distribution -- write first!

Address: Heim Verlag, PD Abonnement, Heidleberger Landstrasse 194, 6100 Darmstadt 13 GERMANY

ST-Magazin (formerly 68000er):

(monthly) Typical issue: around 150 pages. Includes DTP-magazine CICERO.

Subscription: DM 77 (domestic distribution); foreign - write for information

Address: ST-Magazin, Bretonischer Ring 13, 8011 Grasbrunn, West Germany, Phone: ++49 89 456 160

ST Computer:
---

11 issues/year, typical around 180 pages

Subscription: DM 80 (domestic), DM 100 (normal mail), DM 130 (air mail)

Address: Heim Verlag, Heidelberger Landstr. 194, D-6100 Darmstadt 13 GERMANY

French Mags:

ST Magazine

Monthly in French. Oriented towards developers, professional users. Comes with a disk each month.
ST Magazine - 10, rue Hegesippe Moreau - 75018 Paris - France
(French Teletel users: 3615 Teletel access, code STMAG)

STart Micro

Monthly, includes a cover disk. 11 issues per year. 64 + 16 (separated) pages.
Price: FF38 per issue, subscription: FF360. Subjects: Desktop publishing,
graphics, initiations to C and GFA Basic, survey of outcoming software, music,
folders. Minitel access: 3615 code ATARI. Address: FC Press, 57 rue Danton,
92300 Levallois-Perret, France.

Dutch Mags

ST, published by Stichting ST , postbus 11129 2301 EC Leiden the Netherlands
---
cover price: fl 6,95
Independent magazine by and for atari ST users.
covers all different topics from applications to games and hardware.
60 pages.

6 times a year. One year subscription fl 35,-
black and white pages.

START, published by Divo , M. Gijzenburg 14, 2907 HG Capelle a/d IJssel
---
cover price: fl 7,50 (may be more now)
All round magazine, floppy-service available for published programs.
68 pages. 2 color print

6 publications a year. One year subscription fl 39,95
including floppydisk fl 119,95

Atacom, by Atari Club Groningen.

Never seen this one. I suppose you have to be a member of the club or so.
price is fl 4,95.
Adress of the club: Atari Club Groningen, Postbus 9164
9703 LD Groningen, the Netherlands.

Atari Nieuws, by Atari ST computer club Nederland

News paper sized publication. Lots of colour on newspaper pages. Not too many
pages though.
price is fl 3,95 (cheap cheap)
monthly publication.
adress: ACN, Postbus 5011, 2000 CA Haarlem, the Netherlands.

GFA-info, by GFA gg (usergroup)

Publication of the GFA-basic usergroup. This group has a lot of mainly
educational software available.
price is fl 5,00

adress: GFA gg, Frankrijklaan 14, 2034 BA Haarlem, the Netherlands

ST News, by Stichting Computers Eindhoven

This is an electronic magazine. It has been around for about 6 years now
and is completely in English!!! The first issues were in Wordplus format
back in 1986 but from the 6th issue on it included a readerprogram
both for color and monochrome. Even with music.
price is fl 10,00
adress: S.C.E., Kornoeljelaan 22, 5552 RC Valkenswaard

:TIPS:
TIPS AND HINTS from other users
==========

Any 'multisync' monitor which handles 70 video fields a second can be used
with the ST; the custom cable involves no tricks, or commercial ones are
available. The original NEC multisync does NOT handle 70 fields a sec.

More than 3 bombs often means more than 1 error, so interpretations are
tricky.

An ST-formatted disk which is not readable by a PC can be made readable by
putting the 3 bytes EB 34 90 (those were 3 bytes of hex) at the beginning
of the boot sector (sector 1 of track 0, I believe). This can be done with
either an ST or PC absolute sector editor. The Desktop of TOS 1.4 and
higher does this automatically.

Some (older) PC-3.5"-drives cannot deal with the short track-header produced
by ST formatters. On those drives, ST-formatted disks are not readable,
independent of their boot sector contents. The other way, however, does
always work: format on the PC.

When using disks formatted on a PC in an ST, make sure to insert and access
a disk with a different serial number in between disk changes.

For those with the 'inaccessible' mouse and joystick ports, a joystick
extender cable will make life easier. The Y-cable joystick extenders make
it extremely easy to keep mouse and joystick connected to port 0, and a
joystick extender cable in port 1 makes for easy hookup after you've moved
the machine.

BARREL is a program which can redirect printer-data to a file. It comes in
handy when your printer is unavailable, and the program does not already
have an option to 'print-to-a-file'. (It is available on the atari.archive
server.)

DBLEFEAT is a program which can redirect disk access from, say, drive A to
drive B. Handy when a program 'hard-codes' the data drive, and you
wish to use your hard drive instead. (It is available on the atari.archive
server.)

On the Desktop of TOS 1.4 or higher, holding the right mouse button allows
you to manipulate files in other windows. This is useful for a number
of reasons. An example is this: say D:\BLAH.ARC is a file you would
like to extract to D:\, but ARC.TTP is on C:\. Top D:\'s window, then

hold the right button while double-clicking ARC.TTP in an inactive window.
(I've been told this will work on 1.2, and possibly other TOSi.)

:ZNET:
Where can I get copies of ZNET?
==========

ZNET is now Atari Explorer Online. Please see EXPLOR for more info.

:EXPLOR:
Where can I get copies of Atari Explorer Online?
==========
Atari Explorer Online magazine is available on CompuServe and GEnie. You can
also get copies mailed to you by sending an e-mail message to

stzmagazine-request@virginia.edu

indicating you wish to subscribe.

They won't get to you on Friday (which is when they're posted), but Greg
Lindahl provides an excellent service to the networking community by sending
these out.

Atari Explorer Online and some information from the Current Notes user
magazine are also available from the atari.archive server under
/atari/magazines.

:PD:
Where can I get Public Domain/Shareware software?
==========

There are FTP sources and a comp.sources.atari.st/comp.binaries.atari.st
mail server. You can also try the commercial on-line services such as
GEnie, CompuServe, Delphi and Bix.

Using FTP, most files should be retrieved in BINARY format (at least those
ending with the suffix of .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

Mail servers encode files. You will need a program called 'uudecode' in
order to change files ending with the suffix .UUE (or .UAB, .UAC, etc.)
into their original form.

:MAIL:
E-Mail file servers

archive-server@spud.hyperion.com:

Spud holds all of the comp.sources.atari.st / comp.binaries.atari.st
postings. If you aren't reading these two newsgroups, you should consider
doing so. You may obtain uuencoded files as e-mail. You can obtain a
help file by mailing a message to archive-server@spud.hyperion.com, with
the main body of the message being the word 'help'.

atari@atari.archive.umich.edu:

The atari.archive server is mentioned many times in this article. It contains a multitude of Atari ST PD and shareware programs. If you don't have access via FTP you can obtain many of the files via e-mail. You should first obtain a help file by mailing a message to atari@atari.archive.umich.edu, with the main body of the message being the word 'help.'. If you are from a uucp site, please enclose this statement also 'path host1!host2!....', where host1!host2!... is your path. Please read the help file completely before you ask questions, and then send any you may have to jon@atari.archive.umich.edu. Any questions about the archive or specific files go to weiner@atari.archive.umich.edu (or weiner@terminator.rs.itd.umich.edu, jeff.weiner@um.cc.umich.edu, weiner@zircon.labmed.umn.edu, or weiner@umnstat.stat.umn.edu :-)

archive-server@micros.hensa.uk.ac:

This is a UK public domain archive, available to sites within the UK via via JANET.

info-server@Germany.EU.net:

This is a german public domain archive. This only has comp.binaries.atari.st and comp.sources.atari.st.

archive-server@Germany.EU.net:

Same place as above, but this one carries other software than just comp.binaries.atari.st and comp.sources.atari.st.

mail-server@cs.ruu.nl (or uunet!mcsun!hp4nl!ruuinf!mail-server):
---
send the following message

begin
path john@highbrow.edu (PLEASE SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/index
end

NOTE: *** PLEASE USE VALID INTERNET ADDRESSES IF POSSIBLE. DO NOT USE ADDRESSES WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET ***

The path command can be deleted if we receive a valid from address in your message. If this is the first time you use our mail server, we suggest you first issue the request:
send HELP

LISTSERV@UOGUELPH.BITNET:

Mail messages with the contents HELP will bring you some usage information
and GET PROG-A16 FILELIST will provide you with a list of files. Subscriptions
to INFO-A16 are also available on this server. INFO-A16 is a digest of
messages from comp.sys.atari.st.

:FTP:
Anonymous FTP servers

Note: The generally accepted practice for FTP use is as follows:

1. Limit access times to non-working hours. This is usually 6-8 pm
to 8-9 am LOCAL time. LOCAL time means local to the computer
you are accessing! For example, 4 P.M. in Minneapolis, Minnesota
is 10 P.M. in England, and 10 A.M. in Germany is 4 A.M. in New
York.

2. Once you connect, issue the following commands at your FTP
prompt:

user anonymous
<YOUR e-mail address should be entered at the Password: prompt)
ls
cd <to the appropriate directory>

3. Limit downloads, especially across the ocean. Remember, there are
other people who are using the same lines as you.

Atari FTP sites (the list is -not- exhaustive)
---

atari.archive.umich.edu [141.211.164.8]

uk.ac.lancs.pdsoft (available to UK users via JANET)

Note: Access is a bit different for this archive site, use the following:

user pdsoft
pdsoft (at the Password prompt)

ftp.Germany.EU.net [192.76.144.75]

ftp.cs.ruu.nl [131.211.80.17]

:COMP:
Atari-related companies
==========

This is a (still under construction) list of companies and addresses that
might be of use to Atari ST users. Please send me addresses for the blank ones
on this list. See also IAAD, it lists many more companies that are not on
this list.

Archive-name: csas-faq/part2

Welcome to comp.sys.atari.st! Please read this FAQ before posting a question
to comp.sys.atari.st, since a lot of common questions are answered here.

Thanks to David Paschall-Zimbel (davidli@simvax.labmed.umn.edu) for
compiling most of this FAQ.

The following is an index of the questions answered in this part of the FAQ.
For easy access to a particular question, search for the tag surrounded by
colons (i. e. :GNU:). Questions marked with '*' are new or changed.

Welcome to comp.sys.atari.st
============================

This newsgroup is devoted to discussion about 16 and 32 bit Atari micros. At
present that includes the Atari 520ST, 1040ST, Mega ST, STe, STacy, Mega STe,
and the Atari TT. There are also emulators for the Apple Macintosh and IBM
PC/XT/AT available.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.

Associated newsgroups include:

comp.binaries.atari.st ! uuencoded binary programs
comp.sys.atari.st.tech ! technical programming/hardware topics
comp.sources.atari.st ! uuencoded/shar sources

:ARCS:
How do I deal with Archived files (.ZOO, .ARC, .LZH)?
==========

Files ending with suffixes .ZOO, .ARC and .LZH are archive files. They are binary files which may contain one or more other files in a compressed format. Archive files usually take up less disk space, and for this reason have become quite popular for transferring large files via modem.

In order to extract the files from an archive file, one must use an archive program. Here are the correspondences:

ARC Use ARC.TTP
LZH Use LHARC.TTP
ZOO Use ZOO.TTP

A few hints for first-time users:

* Most archivers will give a short summary of commands if invoked with no arguments.
* If in doubt, to extract a file, copy the archiver to the directory that the file is in, and run the archiver with the arguments 'x [filename]'.
* If you have TOS 1.4 or higher, and/or a CLI, you can avoid copying the archiver by just changing the current directory to where the file is. See TIPS for a tip on how to do this from the desktop on TOS 1.4 or higher.
* Read the documentation for the archivers you use, they will almost certainly answer all your questions. Documentation is usually included in both the source and binary distributions (such as zoo21bin.zoo).

ARCHIVERS
These programs are all available via FTP from the atari.archive server, in the /atari/archivers directory. Recommended files are:

arc602.ttp - version 6.02 of ARC, includes features to archive subdirectories and also include comments with files.

arc602.arc - contains documentation. UnArc using arc602.ttp.

arc521e.arc - older version of ARC. Used mostly by those who want speed, better compression, and don't care about archiving subdirectories. UnArc using arc602.ttp.

lharc.ttp - version 2.0 of LHARC.

lzh201i.lzh - Thomas Questors lzh utility. German documentation. UnArc using lharc.ttp

zoo21.ttp - version 2.1 of ZOO

zoo21bin.zoo - ZOO archive includes documentation. UnArc using zoo21.ttp.

:MSA:
Some info on Magic Shadow Archiver
==================================
(This was provided by Chris Herborth)

MSA Archives

The Magic Shadow Archiver (MSA) is a disk archiving program that allows an entire disk to be compressed into one file for transmission. The Magic Shadow Archiver (in shadow.[arc?|lzh?|zoo?] on atari.archive.umich.edu in ~/Archivers) creates .MSA files, which are often compressed using a normal archiver, such as zoo or lharc.

Magic Shadow is notoriously bad when used on a 1/2 meg ST and only one floppy drive. Its disk access and memory use are very badly thought out, and could result in over 160 disk swaps when unpacking an 80 track, double-sided disk.

Due to the fact that it was the _only_ disk image archiver around for quite a long time, Magic Shadow is the de-facto standard for creating disk images of computer demos and other pieces of software that cannot be easily compressed as files.

Because MSA files are disk images, they can only be used to recreate a floppy disk. There is (currently, see below) no way to extract the files from an MSA archive without writing it to a floppy disk.

Magic Shadow works perfectly with any legal TOS floppy format, even high density disks found in modified STs and most MegaSTes and TTs.

Chris Herborth (herborth@pinot.waterloo.ncr.com at work, cherborth@semprini.tdkcs.waterloo.on.ca at home, C.HERBORTH on GEnie) is writing a much more efficient MSA extractor, called UnMSA. UnMSA will minimize the number of disk swaps, and speed decompression considerably.

Daryl Richards (no email address, yet) is working on an MSA-Mounter, which will allow someone to unpack an MSA archive to RAM or a file on a hard disk. This uncompressed disk image will then be added to the system as a logical drive (much the same way a RAMdisk adds a drive to the system). MountImage on the Mac is an example of the way MSA-Mounter will eventually work (MountImage is so good, you can install new versions of the Mac OS using floppy disk images stored on your hard drive).

:CLI:
What Command Line Interpreters are available?
===

There are a large number of Command Line Interpreters for the Atari ST. Some of the more popular ones include:

gulam the 'classic' cli, somewhat UNIX in flavor

BASH GNU Bourne Again Shell

ksh Korn Shell - available under MINT

gemini MUPFEL is the shell used by the gemini environment

master MS-DOS/Unix mixture, shareware.

okami a German shell with many useful utilities built in

pcommand an MS-DOS-like shell

csh C-shell, standard on Unix

tcsh Enchanced C-shell - available under MiNT

Check atari.archive under /atari/cli or /atari/mint, or check one of the
other FTP sites for files.

:ERR:
What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

The information below was written, in part, by Darryl May, and posted on
GEnie in January (of ????) by John Townsend. The original also appeared in
the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA
22170). It has since found its way to me, and is being posted to
comp.sys.atari.st as a service to readers.

Alan Pratt wrote to tell me that the basic information may be correct, but
that it cannot be dubbed "official" unless it originates, on paper, from
Atari. This makes sense, as electronic communications are easily
modified, even accidentally.

Roland Waldi provided information regarding the difference between TOS and
GEM return codes which appears to be correct. The tables have been modified
to reflect his information.

The following is an unofficial list of the errors that can appear
while you are operating your ST computer.

Error description return code alert box #
==========
OK (no error).....0
Fundamental error.....-1
Drive not ready.....-2
Unknown command.....-3
CRC error.....-4
Bad request.....-5
Seek error.....-6
Unknown media.....-7
Sector not found.....-8
No paper.....-9
Write fault.....-10
Read fault.....-11
General error.....-12

```
Write protect..................-13
Media change...................-14
Unknown device.................-15
Bad sectors on format..........-16
Insert other disk..............-17
Invalid function number.........-32.............1
File not found.................-33.............2
Path not found.................-34.............3
No handles left................-35.............4
Access denied..................-36.............5
Invalid handle.................-37.............6
Insufficient memory............-39.............8
Invalid memory block address...-40.............9
Invalid drive specified.........-46............15

No more files..................-49............18
Range error....................-64............33
Internal error.................-65............34
Invalid program load format....-66............35

The last code is the infamous "TOS error 35"!

Also, some unofficial information via Alan Pratt:

Notably, you should add -48: ENSAME (not the same drive, occurs when
you call Frename and the two names you give aren't on the same drive),
and -67: EGSBF: you can't use Mshrink to GROW a block of memory.

Those bombs that appear on your screen are error messages from
the 68000 micro-processor.

Number
Description of bombs

:GDOS:
What is GDOS, and where can I get it?
==========

GDOS stands for Graphic Device Output System (at least that's what my copy of STart, volume 1 number 1 said...)

There is a newer version, called FSMGDOS, which should be available commercially from Atari. It is currently included with WordFlair II. FSMGDOS uses scaleable fonts - you do not need to create a font file for every point size. Current word is that the street price for FSMGDOS will be about $50. The Lucida font family comes with FSMGDOS, and the output is very nice, even on a 9-pin Epson printer. There are desk accessories which allow you to manipulate available fonts, and also CPX programs for the newer Atari Control Panel. For those who only have limited memory, a newer version of GDOS is also included with the distribution. For those with investments in older bit-mapped GDOS fonts, they may be used with the new version of GDOS or used as bit-mapped (ie. non-scaleable) fonts within FSMGDOS.

You can get a copy of "Everything You Ever Wanted to Know About GDOS (and more)" by Douglas N. Wheeler from the atari.archive server. The file is /atari/programming/gdos.arc.

There is a German version of GDOS available from the atari.archive server. The file is /atari/utilities/amcgdos.arc.

Currently, there are no truly public domain sources for the GDOS system files or font files (at least those supplied by Atari). You can get these files with many commercial programs, such as Degas Elite, WordFlair, etc. You might also want to check your local user group to see if they received a copy of the WordFlair demo program (also available on GEnie). The demo program appears to have the GDOS system and font files.

:GNU:
What GNU software is available for the ST?
==========

The Free Software Foundation C compiler, commonly known as GNU C (or gcc) is avaiable for the Atari ST. The minimal memory required to do any useful (i.e. beyond 'hello world') programming is 2 megabytes. A 4 megabyte system is recommended.

There is an extensive archive of the latest GNU C programs via anonymous FTP on atari.archive. GNU C is also available at most European FTP sites. The latest version of GCC available for the ST is 2.2.2, this version includes built-in support for C++.

Note that most GNU documentation comes in TeXinfo format. Documentation in this format can be fed into TeX for printing. It can also be processed by Emacs' texinfo to make an info file, which can be viewed on-screen with Emacs' info mode. These two functions can also be performed by the standalone programs 'texinfo' and 'info' (on atari.archive as /atari/tex/tnxf241b.zoo).

The following can be found in the /atari/gnustuff/tos directory of atari.archive: (Note: all of these have Unixmode and MiNT support)

BASH Bourne-again shell
BISON Yet another YACC (Yet Another Compiler Compiler)
COMPRESS Compatible with Unix compress
DIFF Compares files; PATCH does the inverse
EMACS Extreme editor :-)
Fileutils Unix file utilities
FLEX Lexical analyzer, like Unix lex
GAWK AWK report generation language
GCC 2.1 C, C++ compiler
GDB GNU debugger, with source level C support
Ghostscript Postscript clone
GROFF Text formatting system
GREP Regular expression search, like Unix grep
MAKE Like Unix make
MAKEINFO Stand-alone system to process .info files
PATCH Changes files from diffs; DIFF does the inverse
PROF Profiles executable code
RCS Revision Control System
SED Stream editor
Smalltalk Smalltalk; object oriented language
TAR Tape archiver like Unix tar

:HAM:
Where can I find Ham Radio software for the ST?
==========

Plenty of Ham Radio software is available for the Atari ST:

Morse code
Radio Teletype (RTTY)
Packet Radio (W0RLI BBS and K9AQ TCP/IP)
Satellite Tracking
WEFAX
Color Slow Scan TV (SSTV)
etc.

For more information contact the Atari Microcomputer Network:

Newsletter Editor - Gil Frederick, VE4AG
130 Maureen Street
Winnipeg, Manitoba
R3K 1M2 Canada
or
Program Librarian - John Adams, KC5FW
17106 Happy Hollow
San Antonio, TX 78232
U.S.A.
or
Tune into the weekly net Sundays 16:00 UTC on 14.325 MHz.

73,
John Langner, WB2OSZ

:LANG:
Public Domain/Shareware languages...
====================================

There are a large number of programming languages available for use with the Atari ST. Programmers seem to flock to the Atari ST, and if you know of a language, you can probably find it, or an equivalent, for the ST.

68000 assembler/disassembler
abc
APL
AWK
BASIC
C
C++
cross assemblers (z80, 6502, 68xx,8031/80xx)
Elan
FORTRAN
FORTH
FP
Hope
ICON
LISP
Little Smalltalk
Modula2
OPS5
perl
PROLOG
SCHEME
SIOD
Smalltalk
XLisp
XProlog
XScheme

Check the atari.archive server under /atari/languages. Most other archive sites will have a language directory which you can also check.

:MINIX:
Is MINIX available on the Atari ST?
==========

MINIX is a UNIX-like operating system for the IBM PC, XT, AT, 386,
and PS/2, as well as the Apple Macintosh, Commodore Amiga, Atari ST, and
later in 1991, Sun SPARC. It is available with all the source code for
the entire operating system, the libraries, and nearly 200 UNIX-like
utilities.

Demonstration disks for the IBM PC line and Atari ST are available for free
via anonymous FTP for people on the Internet. A Macintosh version will be
online soon. (If you can't wait, see below.)

To get a free demo disk and the manual, use ftp to connect to
ftp.cs.vu.nl (192.31.231.42) and look in pub/minix/demo. The READ_ME
file describes the contents of the directory and how to use it. Be sure to
fetch and read this first. It contains important information.

If you don't have FTP access, you can buy the demo disk package from Prentice-
Hall for $10 by calling (201) 767-5969 or FAX (201) 767-5625. Please DON'T
ask me to send it by email. I have quite enough work already thank you.
The ordering numbers for Prentice-Hall are:

- MINIX 1.5 IBM demo disk (0-13-582768-x) (in stock now)
- MINIX 1.5 Atari demo disk (0-13-582792-2) (in stock now)
- MINIX 1.5 Macintosh demo disk (0-13-582784-1) (in stock now)

Please note that although the demo disks are available for free on line,
MINIX itself is copyrighted software and is not available on line. The
demo disks are also copyrighted, but permission is hereby granted to
upload and use them for evaluation purposes. The READ_ME file tells how
MINIX can be ordered.

AS A COURTESY TO US, PLEASE DO NOT FTP DURING BUSINESS HOURS (EUROPEAN
TIME). PLEASE FTP AFTER 11 A.M. EASTERN STANDARD TIME.
If you want to follow the MINIX discussion, read the comp.os.minix
newsgroup, which is quite active and has almost 50,000 subscribers.

Have fun!

Andy Tanenbaum (ast@cs.vu.nl)

:MINT:
What is MiNT?
==========
MiNT is a free multitasking operating system extension for TOS. It is somewhat
like BSD Unix from the programmer's perspective. MiNT can run up to 1 GEM
program along with a lot of character-based programs simultaneously. MGR
and MW2 can both put multiple terminal windows on screen, and bgacc can
put a number of terminal windows on a GEM screen. MiNT and lots of stuff to go
with it can be found at atari.archive.umich.edu:/atari/mint.

TOSWIN is the new replacement for bgacc: it provides lots of nice features like
variable fonts, menus, selectable window gadgets, etc. GEMTERM is a similar

package (it's not part of the standard MiNT distribution) modelled after TOSWIN and XTerm.

A somewhat interesting note: MiNT is now the kernel of Atari's multitasking OS, MultiTOS. Originially MiNT stood for 'MiNT is Not TOS', but it's now 'MiNT is Now TOS'. :-)

:XWIN:
Is there a version of XWindows for the ST?
==========

Currently, there is no XWindows port for the ST. It is quite unlikely that there will be one, although you are free to port it if you like :-). There does exist a port for the TT (and presumably Falcon) as part of Atari's Unix distribution.

:DEMOS:
Why won't demo x run on my machine?
==========

90% of the time, if a demo does not run on your American ST, you probably need to be in 50Hz mode to use it. Get a program like 50hzboot.prg from atari.archive to allow this.

:PAINT:
What is the format for [x] paint program data?
==========

There is a periodic posting of ST Picture Formats, edited by David Baggett. The file is on the atari.archive server under /atari/graphics/picfmts.doc.

:PD:
Where can I get Public Domain/Shareware software?
==========

There are FTP sources and a comp.sources.atari.st/comp.binaries.atari.st mail server. You can also try the commercial on-line services such as GEnie, CompuServe, Delphi and Bix.

Using FTP, most files should be retrieved in BINARY format (at least those ending with the suffix of .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

Mail servers encode files. You will need a program called 'uudecode' in order to change files ending with the suffix .UUE (or .UAB, .UAC, etc.) into their original form.

:MAIL:
E-Mail file servers

archive-server@spud.hyperion.com:

Spud holds all of the comp.sources.atari.st / comp.binaries.atari.st postings. If you aren't reading these two newsgroups, you should consider doing so. You may obtain uuencoded files as e-mail. You can obtain a

help file by mailing a message to archive-server@spud.hyperion.com, with
the main body of the message being the word 'help'.

atari@atari.archive.umich.edu:

The atari.archive server is mentioned many times in this article. It contains
a multitude of Atari ST PD and shareware programs. If you don't have access
via FTP you can obtain many of the files via e-mail. You should first obtain a
help file by mailing a message to atari@atari.archive.umich.edu, with the main
body of the message being the word 'help.'. If you are from a uucp site,
please enclose this statement also 'path host1!host2!....', where
host1!host2!... is your path. Please read the help file completely before you
ask questions, and then send any you may have to jon@atari.archive.umich.edu.
Any questions about the archive or specific files go to
weiner@atari.archive.umich.edu (or weiner@terminator.rs.itd.umich.edu,
jeff.weiner@um.cc.umich.edu, weiner@zircon.labmed.umn.edu, or
weiner@umnstat.stat.umn.edu :-)

archive-server@micros.hensa.uk.ac:

This is a UK public domain archive, available to sites within the UK via
via JANET.

info-server@Germany.EU.net:

This is a german public domain archive. This only has comp.binaries.atari.st
and comp.sources.atari.st.

archive-server@Germany.EU.net:

Same place as above, but this one carries other software than just
comp.binaries.atari.st and comp.sources.atari.st.

mail-server@cs.ruu.nl (or uunet!mcsun!hp4nl!ruuinf!mail-server):
---
send the following message

begin
path john@highbrow.edu (PLEASE SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/index
end

NOTE: *** PLEASE USE VALID INTERNET ADDRESSES IF POSSIBLE. DO NOT USE
ADDRESSES WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET ***

The path command can be deleted if we receive a valid from address in your
message. If this is the first time you use our mail server, we suggest you
first issue the request:
send HELP

LISTSERV@UOGUELPH.BITNET:

Mail messages with the contents HELP will bring you some usage information
and GET PROG-A16 FILELIST will provide you with a list of files. Subscriptions
to INFO-A16 are also available on this server. INFO-A16 is a digest of
messages from comp.sys.atari.st.

:FTP:
Anonymous FTP servers

Note: The generally accepted practice for FTP use is as follows:

1. Limit access times to non-working hours. This is usually 6-8 pm
to 8-9 am LOCAL time. LOCAL time means local to the computer
you are accessing! For example, 4 P.M. in Minneapolis, Minnesota
is 10 P.M. in England, and 10 A.M. in Germany is 4 A.M. in New
York.

2. Once you connect, issue the following commands at your FTP
prompt:

user anonymous
<YOUR e-mail address should be entered at the Password: prompt)
ls
cd <to the appropriate directory>

3. Limit downloads, especially across the ocean. Remember, there are
other people who are using the same lines as you.

Atari FTP sites (the list is -not- exhaustive)
---

atari.archive.umich.edu [141.211.164.8]

uk.ac.lancs.pdsoft (available to UK users via JANET)

Note: Access is a bit different for this archive site, use the following:

user pdsoft
pdsoft (at the Password prompt)

ftp.Germany.EU.net [192.76.144.75]

ftp.cs.ruu.nl [131.211.80.17]

:TEX:
Is TeX/LaTeX available on the Atari ST?
==========

The TeX/LaTeX typesetting programs are available on the Atari ST. Check the
atari.archive server under /atari/tex. Fonts and device drivers
(including one for the Epson 9-pin printers) are available on the
atari.archive server.

The latest version of TeX (3.14) has recently been made available on the
atari.archive server. The files are in a subdirectory of their own.

Graham Higgins recently wrote a message in comp.sys.atari.st indicating the minimum files needed to get a working TeX/LaTeX system up and running on the Atari ST. He said:

You'll need, at minimum:

The binaries for LaTeX/TeX :StTeXBin
The style files :StTeXSty
The font macros :StTeXTfm

If you want to screen-preview, you'll need screen font files (showdvi)
If you want to print locally, you'll need printer font files (dvifont)

Allow 5Mb.

For a step-by-step article on setting up Tex and LaTeX, send an e-mail request to davidli@simvax.labmed.umn.edu. Be sure to mention 'tex.setup'.

There is also a complete, ready-to-install distribution called CS-TeX. The latest version, 4.0, is available at atari.archive: /atari/tex/cs-tex-4.0. This consists of 8 disks full of TeX stuff, plus an installation program that takes care of the details for you.

>some of us can afford or are willing to pay for a computer.
>

Oddly enough, $1500 CDN is *exactly* what a friend paid a couple weeks ago for his 486-33 system. That's including tax, and also including an SVGA monitor, a 105 meg hard disk, 3.5 & 5 1/4" floppies, 4 meg of ram, 512k SVGA card, etc...

The pricing for clones is getting rather scarey, isn't it?

Well I can't say specifically what is wrong but having talk to service techs
about Atari drives I recall that the MegaFile 30 was not a very reliable drive
and invariably died in about a year. He recommended to stay away from this
drive and get a MegaFile 20 or 60 as they had much more reliable workings (I've
had my 20 for many years). I realise that this doesn't help you much. I would
suggest backing it up immediatly and having it looked at.

> shadows to the left of everything. A straight line down the page looks
> like two lines about 1/2mm apart with the left one being very inconsistant.

A friend of mine had a similar problem, which we cured by switching the order of components connectd along the DMA chain - he originally had ST-hard disks-SLM804 controller, and the problem disappeared when we switched it to ST-SLM804-hard disks. (Or it might have been the other way round - can't remember, and from my experience with such setups there's no logic to it.)

No guarantees, but maybe worth a try if all else fails.

Graham

In the UK they sell a 128Mb optical drive with The Link so I'd guess
that yes, it would work.

And right here in America, US $899 will buy you a 20Mhz 486SX, 2 MB memory
SVGA monitor, 85 MByte hard drive from chain store Montgomery Ward...

Today's magic atari password is "tick, tick, tick..."

Why not consider an accelerator board for your MST 4? There are a slew of
options available to you from ICD, Fast Technology, and Gadgets by Small
not to mention some of the European accelerator boards.

There is still a lot of confusion centering around Richter Distribution's
GFA BASIC 4.0 announcement. The U.S. GFA office has announced a version 3.7
of GFA BASIC for the Atari to be released "RSN". How this conflicts with
Richter's 4.0 is a mystery. Wish we could get some straight answers!
